### G4.18.10 TLB maintenance instructions, functional group

Table G4-60 shows the VMSAv8-32 TLB maintenance instructions functional group. *The scope of TLB maintenance instructions* on page G4-4069 describes the operations.

**Table G4-60 TLB maintenance instructions**

| Name[a] | CRn | opc1 | CRm | opc2 | Width | Type | Description | Limits[b] |
|---|---|---|---|---|---|---|---|---|
| DTLBIALL[c] | c8 | 0 | c6 | 0 | 32-bit | WO | Invalidate entire data TLB | - |
| DTLBIASID[c] | c8 | 0 | c6 | 2 | 32-bit | WO | Invalidate data TLB by ASID | - |
| DTLBIMVA[c] | c8 | 0 | c6 | 1 | 32-bit | WO | Invalidate data TLB entry by VA | - |
| ITLBIALL[c] | c8 | 0 | c5 | 0 | 32-bit | WO | Invalidate entire instruction TLB | - |
| ITLBIASID[c] | c8 | 0 | c5 | 2 | 32-bit | WO | Invalidate instruction TLB by ASID | - |
| ITLBIMVA[c] | c8 | 0 | c5 | 1 | 32-bit | WO | Invalidate instruction TLB by VA | - |
| TLBIALL[d] | c8 | 0 | c7 | 0 | 32-bit | WO | Invalidate entire unified TLB | - |
| TLBIALLH | c8 | 4 | c7 | 0 | 32-bit | WO | Invalidate entire Hyp unified TLB | - |
| TLBIALLHIS | c8 | 4 | c3 | 0 | 32-bit | WO | Invalidate entire Hyp unified TLB | IS |
| TLBIALLIS | c8 | 0 | c3 | 0 | 32-bit | WO | Invalidate entire unified TLB | IS |
| TLBIALLNSNH | c8 | 4 | c7 | 4 | 32-bit | WO | Invalidate entire Non-secure Non-Hyp unified TLB | - |
| TLBIALLNSNHIS | c8 | 4 | c3 | 4 | 32-bit | WO | Invalidate entire Non-secure Non-Hyp unified TLB | IS |
| TLBIASID | c8 | 0 | c7 | 2 | 32-bit | WO | Invalidate unified TLB by ASID | - |
| TLBIASIDIS | c8 | 0 | c3 | 2 | 32-bit | WO | Invalidate unified TLB by ASID | IS |
| TLBIIPAS2 | c8 | 4 | c4 | 1 | 32-bit | WO | TLB Invalidate entry by IPA, Stage 2 | - |
| TLBIIPAS2IS | c8 | 4 | c0 | 1 | 32-bit | WO | TLB Invalidate entry by IPA, Stage 2, Inner Shareable | IS |
| TLBIIPAS2L | c8 | 4 | c4 | 5 | 32-bit | WO | TLB Invalidate entry by IPA, Stage 2, Last level | - |
| TLBIIPAS2LIS | c8 | 4 | c0 | 5 | 32-bit | WO | TLB Invalidate entry by IPA, Stage 2, Last level, Inner Shareable | IS |
| TLBIMVAA | c8 | 0 | c7 | 3 | 32-bit | WO | Invalidate unified TLB by VA, all ASID | - |
| TLBIMVAAIS | c8 | 0 | c3 | 3 | 32-bit | WO | Invalidate unified TLB by VA, all ASID | IS |
| TLBIMVAAL | c8 | 0 | c7 | 7 | 32-bit | WO | TLB Invalidate entry by MVA, All ASID, Last level | - |
| TLBIMVAALIS | c8 | 0 | c3 | 7 | 32-bit | WO | TLB Invalidate entry by MVA, All ASID, Last level, Inner Shareable | IS |
| TLBIMVA | c8 | 0 | c7 | 1 | 32-bit | WO | Invalidate unified TLB by VA | - |
| TLBIMVAH | c8 | 4 | c7 | 1 | 32-bit | WO | Invalidate Hyp unified TLB by VA | - |
| TLBIMVAHIS | c8 | 4 | c3 | 1 | 32-bit | WO | Invalidate Hyp unified TLB by VA | IS |

Non-Confidential - Beta

**Table G4-60 TLB maintenance instructions (continued)**

| Name[a] | CRn | opc1 | CRm | opc2 | Width | Type | Description | Limits[b] |
|---|---|---|---|---|---|---|---|---|
| TLBIMVAIS | c8 | 0 | c3 | 1 | 32-bit | WO | Invalidate unified TLB by VA | IS |
| TLBIMVAL | c8 | 0 | c7 | 5 | 32-bit | WO | TLB Invalidate entry by MVA, Last level | - |
| TLBIMVALH | c8 | 4 | c7 | 5 | 32-bit | WO | TLB Invalidate entry by MVA, Last level, Hyp mode | - |
| TLBIMVALHIS | c8 | 4 | c3 | 5 | 32-bit | WO | TLB Invalidate entry by MVA, Last level, Hyp mode, Inner Shareable | IS |
| TLBIMVALIS | c8 | 0 | c3 | 5 | 32-bit | WO | TLB Invalidate entry by MVA, Last level | IS |

a. These links are to a summary of the operation, and *The scope of TLB maintenance instructions* on page G4-4069 describes the operation.
b. IS = Inner Shareable.
c. Deprecated. ARM deprecates use of operations that operate only on an Instruction TLB, or only on a Data TLB.
d. The mnemonics for the operations with CRm==c7, opc2== {0, 1, 2} were previously UTLBIALL, UTLBIMVA and UTLBIMASID.

### G4.18.11 Address translation instructions, functional group

Table G4-61 shows the VMSAv8-32 Address translation instructions functional group.

**Table G4-61 Address translation instructions**

| Name | CRn | opc1 | CRm | opc2 | Width | Type | Description |
|---|---|---|---|---|---|---|---|
| ATS12NSOPR[a, c] | c7 | 0 | c8 | 4 | 32-bit | WO | Stages 1 and 2 Non-secure only EL1 read |
| ATS12NSOPW[a, c] | c7 | 0 | c8 | 5 | 32-bit | WO | Stages 1 and 2 Non-secure only EL1 write |
| ATS12NSOUR[a, c] | c7 | 0 | c8 | 6 | 32-bit | WO | Stages 1 and 2 Non-secure only unprivileged read |
| ATS12NSOUW[a, c] | c7 | 0 | c8 | 7 | 32-bit | WO | Stages 1 and 2 Non-secure only unprivileged write |
| ATS1CPR[c] | c7 | 0 | c8 | 0 | 32-bit | WO | Stage 1 Current state EL1 read |
| ATS1CPW[c] | c7 | 0 | c8 | 1 | 32-bit | WO | Stage 1 Current state EL1 write |
| ATS1CUR[c] | c7 | 0 | c8 | 2 | 32-bit | WO | Stage 1 Current state unprivileged read |
| ATS1CUW[c] | c7 | 0 | c8 | 3 | 32-bit | WO | Stage 1 Current state unprivileged write |
| ATS1HR[b, c] | c7 | 4 | c8 | 0 | 32-bit | WO | Stage 1 Hyp mode read |
| ATS1HW[b, c] | c7 | 4 | c8 | 1 | 32-bit | WO | Stage 1 Hyp mode write |
| PAR | c7 | 0 | c4 | 0 | 32-bit | RW | Physical Address Register |
| | - | 0 | c7 | - | 64-bit | RW | |

a. Implemented only as part of EL3. Otherwise, encoding is unallocated and CONSTRAINED UNPREDICTABLE, see *Accesses to unallocated encodings in the CP14 and CP15 encoding space* on page G4-4119.
b. Implemented only as part of EL2. Otherwise, encoding is unallocated and CONSTRAINED UNPREDICTABLE, see *Accesses to unallocated encodings in the CP14 and CP15 encoding space* on page G4-4119.
c. These links are to a summary of the operation.

*Address translation instructions* on page G4-4110 describes these operations.

### G4.18.12 Lockdown, DMA, and TCM features, functional group

Table G4-62 shows the VMSAv8-32 reserved encodings for the Lockdown, DMA, and TCM features registers functional group.

**Table G4-62 Lockdown, DMA, and TCM features, VMSAv8-32**

| Name | CRn | opc1 | CRm | Width | opc2 | Type | Description |
|---|---|---|---|---|---|---|---|
| IMPLEMENTATION DEFINED | c9 | 0-7 | c0-c2 | 32-bit | 0-7 | a | *VMSAv8-32 CP15 c9 register summary* on page G4-4144 |
| | | | c5-c8 | 32-bit | 0-7 | a | |
| | c10 | 0 | c0-c1 | 32-bit | 0-7 | a | *VMSAv8-32 CP15 c10 register summary* on page G4-4145 |
| | | | c4 | 32-bit | 0-7 | a | |
| | | | c8 | 32-bit | 0-7 | a | |
| | c11 | 0-7 | c0-c8 | 32-bit | 0-7 | a | *VMSAv8-32 CP15 c11 register summary* on page G4-4145 |
| | | | c15 | 32-bit | 0-7 | a | |

a. Access depends on the register or operation, and is IMPLEMENTATION DEFINED.

### G4.18.13 Performance Monitors Extension registers, functional group

Table G4-63 shows the VMSAv8-32 Performance Monitors Extension registers functional group. See also *IMPLEMENTATION DEFINED performance monitors* on page G4-4174.

**Table G4-63 Performance Monitors Extension registers**

| Name | CRn | opc1 | CRm | opc2 | Width | Description |
|---|---|---|---|---|---|---|
| PMCCFILTR | c14 | 0 | c15 | 7 | 32-bit | Performance Monitors Cycle Count Filter Register |
| PMCCNTR | c9 | 0 | c13 | 0 | 32-bit | Performance Monitors Cycle Count Register |
| PMCEID0 | c9 | 0 | c12 | 6 | 32-bit | Performance Monitors Common Event Identification register 0 |
| PMCEID1 | c9 | 0 | c12 | 7 | 32-bit | Performance Monitors Common Event Identification register 1 |
| PMCNTENCLR | c9 | 0 | c12 | 2 | 32-bit | Performance Monitors Count Enable Clear register |
| PMCNTENSET | c9 | 0 | c12 | 1 | 32-bit | Performance Monitors Count Enable Set register |
| PMCR | c9 | 0 | c12 | 0 | 32-bit | Performance Monitors Control Register |
| PMEVCNTR<n>, for n==0 to 7 | c14 | 0 | c8 | 0-7 | 32-bit | Performance Monitors Event Count Registers, 0-7 |
| PMEVCNTR<n>, for n==16 to 23 | c14 | 0 | c10 | 0-7 | 32-bit | Performance Monitors Event Count Registers, 16-23 |
| PMEVCNTR<n>, for n==24 to 30 | c14 | 0 | c11 | 0-6 | 32-bit | Performance Monitors Event Count Registers, 24-30 |
| PMEVCNTR<n>, for n==8 to 15 | c14 | 0 | c9 | 0-7 | 32-bit | Performance Monitors Event Count Registers, 8-15 |
| PMEVTYPER<n>, for n==0 to 7 | c14 | 0 | c12 | 0-7 | 32-bit | Performance Monitors Event Type Registers, 0-7 |

Non-Confidential - Beta

**Table G4-63 Performance Monitors Extension registers (continued)**

| Name | CRn | opc1 | CRm | opc2 | Width | Description |
|---|---|---|---|---|---|---|
| PMEVTYPER<n>, for n==16 to 23 | c14 | 0 | c14 | 0-7 | 32-bit | Performance Monitors Event Type Registers, 16-23 |
| PMEVTYPER<n>, for n==17 to 30 | c14 | 0 | c15 | 0-6 | 32-bit | Performance Monitors Event Type Registers, 24-30 |
| PMEVTYPER<n>, for n==8 to 15 | c14 | 0 | c13 | 0-7 | 32-bit | Performance Monitors Event Type Registers, 8-15 |
| PMINTENCLR | c9 | 0 | c14 | 2 | 32-bit | Performance Monitors Interrupt Enable Clear register |
| PMINTENSET | c9 | 0 | c14 | 1 | 32-bit | Performance Monitors Interrupt Enable Set register |
| PMOVSR | c9 | 0 | c12 | 3 | 32-bit | Performance Monitors Overflow Flag Status Register |
| PMOVSSET | c9 | 0 | c14 | 3 | 32-bit | Performance Monitors Overflow Flag Status Set register |
| PMSELR | c9 | 0 | c12 | 5 | 32-bit | Performance Monitors Event Counter Selection Register |
| PMSWINC | c9 | 0 | c12 | 4 | 32-bit | Performance Monitors Software Increment register |
| PMUSERENR | c9 | 0 | c14 | 0 | 32-bit | Performance Monitors User Enable Register |
| PMXEVCNTR | c9 | 0 | c13 | 2 | 32-bit | Performance Monitors Event Count Register |
| PMXEVTYPER | c9 | 0 | c13 | 1 | 32-bit | Performance Monitors Event Type Select Register |

### IMPLEMENTATION DEFINED performance monitors

VMSAv8-32 reserves some additional CP15 c9 encodings for optional additional IMPLEMENTATION DEFINED performance monitors. Table G4-64 shows the allocation of CP15 c9 encodings:

**Table G4-64 Performance Monitors register encoding allocations in CP15 c9**

| CRn | opc1 | CRm | opc2 | Name | Width | Type |
|---|---|---|---|---|---|---|
| c9 | 0-7 | c12-c14 | 0-7 | Performance Monitors Extension registers, see Table G4-63 on page G4-4173 | 32-bit | RW or RO[a] |
| | | c15 | 0-7 | IMPLEMENTATION DEFINED | 32-bit | [b] |

a. The table referenced in the *Name* entry shows the type of each of the OPTIONAL Performance Monitors Extension registers.
b. Access depends on the register or operation, and is IMPLEMENTATION DEFINED.

## G4.18.14 Generic Timer registers, functional group

AArch32 state reserves CP15 primary coprocessor register c14 for access to the Generic Timer registers. Table G4-65 shows the VMSAv8-32 CP15 registers in the Generic Timer registers functional group.

**Table G4-65 Generic Timer registers**

| Name | CRn | opc1 | CRm | opc2 | Width | Type[a] | Description |
|---|---|---|---|---|---|---|---|
| CNTFRQ | c14 | 0 | c0 | 0 | 32-bit | RW | Counter Frequency register |
| CNTHCTL | c14 | 4 | c1 | 0 | 32-bit | RW | Timer EL2 Control register |
| CNTHP_CTL | c14 | 4 | c2 | 1 | 32-bit | RW | EL2 Physical Timer Control register |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table G4-65 Generic Timer registers (continued)**

| Name | CRn | opc1 | CRm | opc2 | Width | Type[a] | Description |
|---|---|---|---|---|---|---|---|
| CNTHP_CVAL | - | 6 | c14 | - | 64-bit | RW | EL2 Physical Timer CompareValue register |
| CNTHP_TVAL | c14 | 4 | c2 | 0 | 32-bit | RW | EL2 Physical TimerValue register |
| CNTKCTL | c14 | 0 | c1 | 0 | 32-bit | RW | Timer EL1 Control register |
| CNTP_CTL | c14 | 0 | c2 | 1 | 32-bit | RW | EL1 Physical Timer Control register |
| CNTP_CVAL | - | 2 | c14 | - | 64-bit | RW | EL1 Physical Timer CompareValue register |
| CNTP_TVAL | c14 | 0 | c2 | 0 | 32-bit | RW | EL1 Physical TimerValue register |
| CNTPCT | - | 0 | c14 | - | 64-bit | RW | Physical Count register |
| CNTV_CTL | c14 | 0 | c3 | 1 | 32-bit | RW | Virtual Timer Control register |
| CNTV_CVAL | - | 3 | c14 | - | 64-bit | RW | Virtual Timer CompareValue register |
| CNTV_TVAL | c14 | 0 | c3 | 0 | 32-bit | RW | Virtual TimerValue register |
| CNTVCT | - | 1 | c14 | - | 64-bit | RO | Virtual Count register |
| CNTVOFF[b] | - | 4 | c14 | - | 64-bit | RW | Virtual Offset register |

a. See the register descriptions for more information. Accessibility can depend on configuration settings as well as on the current Exception level.

b. Implemented as RW as part of the Generic Timer on an implementation that includes EL2 and when EL2 is using AArch32. For more information see *Status of the CNTVOFF register* on page G5-4205.

### G4.18.15 Generic Interrupt Controller System registers, functional groups

From version 3.0 of the GIC architecture specification, the specification defines three groups of System registers, identified by the prefix of the register name:

**ICC_** GIC physical CPU interface System registers.

**ICH_** GIC virtual interface control System registers.

**ICV_** GIC Virtual CPU interface System registers.

**Note**

These registers are in addition to the GIC memory-mapped register groups GICC_, GICD_, GICH_, GICR_, GICV_, and GITS_.

In VMSAv8-32, the GIC System registers are all in the CP15 encoding space with CRn equal to c12. The ICV_* registers have the same {CRn, opc1, CRm, op2} encodings as the corresponding ICC_* registers. For these encodings, GIC register configuration fields determine which register is accessed.

For more information see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0* (ARM IHI 0069).

Table G4-66 on page G4-4176 shows the functional groups of GIC System registers.

### G4.18.16 Legacy feature registers, functional group

Table G4-67 shows the VMSAv8-32 CP15 Legacy features registers.

**Table G4-67 CP15 Legacy features registers**

| Name | CRn | opc1 | CRm | opc2 | Width | Type[a] | Description |
|---|---|---|---|---|---|---|---|
| CP15DMB | c7 | 0 | c10 | 5 | 32-bit | WO, PL0 | *Memory barriers* on page E2-2375 |
| CP15DSB | c7 | 0 | c10 | 4 | 32-bit | WO, PL0 | |
| CP15ISB | c7 | 0 | c5 | 4 | 32-bit | WO, PL0 | |
| FCSEIDR | c13 | 0 | c0 | 0 | 32-bit | [b] | FCSE Process ID Register |

a. PL0 in a Type description indicates that the encoding is accessible by software executing at PL0. See the register description for more information.

b. In ARMv8, the PE does not implement the FCSEIDR, and therefore the register is RO. See the register description for more information.

Table G4-68 shows the VMSAv8-32 CP14 Legacy features registers.

**Table G4-68 CP14 Legacy features registers**

| Name | CRn | opc1 | CRm | opc2 | Width | Type | Description |
|---|---|---|---|---|---|---|---|
| JIDR | c0 | 7 | c0 | 0 | 32-bit | RO | Jazelle ID Register |
| JMCR | c2 | 7 | c0 | 0 | 32-bit | RW | Jazelle Main Configuration Register |
| JOSCR | c1 | 7 | c0 | 0 | 32-bit | RW | Jazelle OS Control Register |

### G4.18.17 IMPLEMENTATION DEFINED registers, functional group

VMSAv8-32 defines some encodings for registers with content that is entirely IMPLEMENTATION DEFINED. Table G4-69 shows these registers.

**Table G4-69 Architectural encodings for registers with IMPLEMENTATION DEFINED content**

| Name | CRn | opc1 | CRm | opc2 | Width | Type | Description |
|---|---|---|---|---|---|---|---|
| ACTLR | c1 | 0 | c0 | 1 | 32-bit | RW | Auxiliary Control Register |
| ACTLR2 | c1 | 0 | c0 | 3 | 32-bit | RW | Auxiliary Control Register 2 |
| ADFSR | c5 | 0 | c1 | 0 | 32-bit | RW | Auxiliary Data Fault Status Register |
| AIDR | c0 | 1 | c0 | 7 | 32-bit | RO | Auxiliary ID Register |
| AIFSR | c5 | 0 | c1 | 1 | 32-bit | RW | Auxiliary Instruction Fault Status Register |
| AMAIR0 | c10 | 0 | c3 | 0 | 32-bit | RW | Auxiliary Memory Attribute Indirection Register 0 |
| AMAIR1 | c10 | 0 | c3 | 1 | 32-bit | RW | Auxiliary Memory Attribute Indirection Register 1 |
| HACR | c1 | 4 | c1 | 7 | 32-bit | RW | Hyp Auxiliary Configuration Register |
| HACTLR | c1 | 4 | c0 | 0 | 32-bit | RW | Hyp Auxiliary System Control Register |
| HACTLR2 | c1 | 4 | c0 | 3 | 32-bit | RW | Hyp Auxiliary System Control Register 2 |
| HADFSR | c5 | 4 | c1 | 0 | 32-bit | RW | Hyp Auxiliary Data Fault Status Register |

Non-Confidential - Beta

**Table G4-69 Architectural encodings for registers with IMPLEMENTATION DEFINED content (continued)**

| Name | CRn | opc1 | CRm | opc2 | Width | Type | Description |
|---|---|---|---|---|---|---|---|
| HAIFSR | c5 | 4 | c1 | 1 | 32-bit | RW | Hyp Auxiliary Instruction Fault Status Register |
| HAMAIR0 | c10 | 4 | c3 | 0 | 32-bit | RW | Hyp Auxiliary Memory Attribute Indirection Register 0 |
| HAMAIR1 | c10 | 4 | c3 | 1 | 32-bit | RW | Hyp Auxiliary Memory Attribute Indirection Register 1 |
| REVIDR | c0 | 0 | c0 | 6 | 32-bit | RO | Revision ID Register |
| TCMTR | c0 | 0 | c0 | 2 | 32-bit | RO | TCM Type Register |

See also *IMPLEMENTATION DEFINED performance monitors* on page G4-4174.

### G4.18.18 Advanced SIMD and floating-point registers, functional group

Table G4-70 shows the VMSAv8-32 Floating-point System registers. These registers are accesses using `VMRS` and `VMSR` instructions, see the register descriptions for more information.

**Table G4-70 Floating-point registers**

| Name | Width | Type | Description |
|---|---|---|---|
| FPEXC | 32-bit | RW | Floating-Point Exception Control register |
| FPSCR | 32-bit | RW | Floating-Point Status and Control Register |
| FPSID | 32-bit | RW[a] | Floating-Point System ID register |
| MVFR0 | 32-bit | RO | Media and VFP Feature Register 0 |
| MVFR1 | 32-bit | RO | Media and VFP Feature Register 1 |
| MVFR2 | 32-bit | RO | Media and VFP Feature Register 2 |

a. When the FPSID is accessible, `VMSR` accesses to the FPSID are ignored.

### G4.18.19 Debug registers, functional group

In AArch32 state, most Debug registers that are accessible through the System registers interface use CP14 encodings, and are accessed with an opc1 value of 0. Table G4-71 shows these registers.

**Table G4-71 System register CP14 encodings of Debug registers**

| Name | CRn | opc2 | CRm | Width | Type | Description |
|---|---|---|---|---|---|---|

## G4.19 Pseudocode description of VMSAv8-32 memory system operations

This section contains pseudocode describing VMSAv8-32 memory operations. The following subsections describe the pseudocode functions:

- *Alignment fault*.
- *Address translation*.
- *Domain checking* on page G4-4185.
- *TLB operations* on page G4-4185.
- *Translation table walk* on page G4-4186.
- *Reporting syndrome information* on page G4-4197.
- *Memory access decode when TEX remap is enabled* on page G4-4199.

See also the pseudocode for general memory system operations in *Pseudocode description of general memory system instructions* on page G3-3979.

### G4.19.1 Alignment fault

The `AlignmentFault()` pseudocode function describes the generation of an Alignment fault Data Abort exception:

```
// AArch32.AlignmentFault()
// ========================

FaultRecord AArch32.AlignmentFault(AccType acctype, boolean iswrite, boolean secondstage)

    ipaddress = bits(40) UNKNOWN;
    domain = bits(4) UNKNOWN;
    level = integer UNKNOWN;
    extflag = bit UNKNOWN;
    debugmoe = bits(4) UNKNOWN;
    s2fs1walk = boolean UNKNOWN;

    return AArch32.CreateFaultRecord(Fault_Alignment, ipaddress,  domain, level, acctype, iswrite,
                                     extflag, debugmoe, secondstage, s2fs1walk);
```

See also *Abort exceptions* on page G3-3985.

### G4.19.2 Address translation

The `TranslateAddress()` and `FullTranslate()` pseudocode functions describe a VMSAv8-32 address translation.

```
// AArch32.TranslateAddress()
// ==========================
// Main entry point for translating an address

AddressDescriptor AArch32.TranslateAddress(bits(32) vaddress, AccType acctype, boolean iswrite,
                                           boolean wasaligned, integer size)

    if PSTATE.EL == EL0 && !ELUsingAArch32(EL1) then
        return AArch64.TranslateAddress(ZeroExtend(vaddress, 64), acctype, iswrite, wasaligned,
                                        size);

    result = AArch32.FullTranslate(vaddress, acctype, iswrite, wasaligned, size);

    if !(acctype IN {AccType_PTW, AccType_IC, AccType_AT}) && !IsFault(result) then
        result.fault = AArch32.CheckDebug(vaddress, acctype, iswrite, size);

    // Update virtual address for abort functions
    result.vaddress = ZeroExtend(vaddress);

    return result;
```

The `FullTranslate()` function calls either:

- The function described in *Address translation when the stage 1 address translation is disabled* on page G4-4184.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- One of the functions described in *Translation table walk* on page G4-4186.

```
// AArch32.FullTranslate()
// =======================
// Perform both stage 1 and stage 2 translation walks for the current translation regime. The
// function used by Address Translation operations is similar except it uses the translation
// regime specified for the instruction.

AddressDescriptor AArch32.FullTranslate(bits(32) vaddress, AccType acctype, boolean iswrite,
                                        boolean wasaligned, integer size)

    // First Stage Translation
    S1 = AArch32.FirstStageTranslate(vaddress, acctype, iswrite, wasaligned, size);

    if !IsFault(S1) && HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1} then
        s2fs1walk = FALSE;
        result = AArch32.SecondStageTranslate(S1, vaddress, acctype, iswrite, wasaligned, s2fs1walk,
                                              size);
    else
        result = S1;

    return result;
```

*Stage 2 translation table walk* on page G4-4194 describes the `CheckS2Permission()` and `CombineS1S2Desc()` pseudocode functions.

## Address translation when the stage 1 address translation is disabled

The `TranslateAddressS1Off()` pseudocode function describes the address translation performed when the stage 1 address translation is disabled.

```
// AArch32.TranslateAddressS1Off()
// ===============================
// Called for stage 1 translations when translation is disabled to supply a default translation.
// Note that there are additional constraints on instruction prefetching that are not described in
// this pseudocode.

TLBRecord AArch32.TranslateAddressS1Off(bits(32) vaddress, AccType acctype, boolean iswrite)
    assert ELUsingAArch32(S1TranslationRegime());

    TLBRecord result;

    if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1} then
        dc = (if ELUsingAArch32(EL2) then HCR.DC else HCR_EL2.DC);
        default_cacheable = (dc == '1');
    else
        default_cacheable = FALSE;

    if default_cacheable then
        // Use default cacheable settings
        result.addrdesc.memattrs.type = MemType_Normal;
        result.addrdesc.memattrs.inner.attrs = MemAttr_WB;      // Write-back
        result.addrdesc.memattrs.inner.hints = MemHint_RWA;
        result.addrdesc.memattrs.shareable = FALSE;
        result.addrdesc.memattrs.outershareable = FALSE;
    elsif acctype != AccType_IFETCH then
        // Treat data as Device
        result.addrdesc.memattrs.type = MemType_Device;
        result.addrdesc.memattrs.device = DeviceType_nGnRnE;
        result.addrdesc.memattrs.inner = MemAttrHints UNKNOWN;
    else
        // Instruction cacheability controlled by SCTLR/HSCTLR.I
        if PSTATE.EL == EL2 then
            cacheable = HSCTLR.I == '1';
        else
            cacheable = SCTLR.I == '1';
        result.addrdesc.memattrs.type = MemType_Normal;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        if cacheable then
            result.addrdesc.memattrs.inner.attrs = MemAttr_WT;
            result.addrdesc.memattrs.inner.hints = MemHint_RA;
        else
            result.addrdesc.memattrs.inner.attrs = MemAttr_NC;
            result.addrdesc.memattrs.inner.hints = MemHint_No;
        result.addrdesc.memattrs.shareable = TRUE;
        result.addrdesc.memattrs.outershareable = TRUE;

    result.addrdesc.memattrs.outer = result.addrdesc.memattrs.inner;

    result.addrdesc.memattrs = MemAttrDefaults(result.addrdesc.memattrs);

    result.perms.ap = bits(3) UNKNOWN;
    result.perms.xn = '0';
    result.perms.pxn = '0';

    result.nG = bit UNKNOWN;
    result.contiguous = boolean UNKNOWN;
    result.domain = bits(4) UNKNOWN;
    result.level = integer UNKNOWN;
    result.blocksize = integer UNKNOWN;
    result.addrdesc.paddress.physicaladdress = ZeroExtend(vaddress);
    result.addrdesc.paddress.NS = if IsSecure() then '0' else '1';
    result.addrdesc.fault = AArch32.NoFault();

    return result;
```

### G4.19.3 Domain checking

The `CheckDomain()` pseudocode function describes domain checking:

```
// AArch32.CheckDomain()
// =====================

(boolean, FaultRecord) AArch32.CheckDomain(bits(4) domain, bits(32) vaddress, integer level,
                                           AccType acctype, boolean iswrite)

    index = 2 * UInt(domain);
    attrfield = DACR<index+1:index>;

    if attrfield == '10' then          // Reserved, maps to an allocated value
        // Reserved value maps to an allocated value
        (-, attrfield) = ConstrainUnpredictableBits();

    if attrfield == '00' then
        fault = AArch32.DomainFault(domain, level, acctype, iswrite);
    else
        fault = AArch32.NoFault();

    permissioncheck = (attrfield == '01');

    return (permissioncheck, fault);
```

### G4.19.4 TLB operations

The `TLBRecord` type represents the contents of a TLB entry:

```
type TLBRecord is (
    Permissions       perms,
    bit               nG,             // '0' = Global, '1' = not Global
    bits(4)           domain,         // AArch32 only
    boolean           contiguous,     // Contiguous bit from page table
    integer           level,          // In AArch32 Short-descriptort format, indicates Section/Page
    integer           blocksize,      // Describes size of memory translated in KBytes
    AddressDescriptor addrdesc
)
```

Non-Confidential - Beta

### G4.19.5 Translation table walk

Because of the complexity of a translation table walk, the following sections describe the different cases:

- *Translation table walk using the Short-descriptor translation table format for stage 1*.
- *Translation table walk using the Long-descriptor translation table format for stage 1* on page G4-4189.
- *Stage 2 translation table walk* on page G4-4194.

#### Translation table walk using the Short-descriptor translation table format for stage 1

The `TranslationTableWalkSD()` pseudocode function describes the translation table walk when the stage 1 translation tables use the Short-descriptor format. It calls the function described in *Stage 2 translation table walk* on page G4-4194 if necessary:

```
// AArch32.TranslationTableWalkSD()
// ================================
// Returns a result of a translation table walk using the Short-descriptor format
//
// Implementations might cache information from memory in any number of non-coherent TLB
// caching structures, and so avoid memory accesses that have been expressed in this
// pseudocode. The use of such TLBs is not expressed in this pseudocode.

TLBRecord AArch32.TranslationTableWalkSD(bits(32) vaddress, AccType acctype, boolean iswrite,
                                         integer size)
    assert ELUsingAArch32(S1TranslationRegime());

    // This is only called when address translation is enabled
    TLBRecord         result;
    AddressDescriptor l1descaddr;
    AddressDescriptor l2descaddr;
    bits(40)      outputaddress;

    // Variables for Abort functions
    ipaddress = bits(40) UNKNOWN;
    secondstage = FALSE;
    s2fs1walk = FALSE;

    // Default setting of the domain
    domain = bits(4) UNKNOWN;

    // Determine correct Translation Table Base Register to use.
    bits(64) ttbr;
    n = UInt(TTBCR.N);
    if n == 0 || IsZero(vaddress<31:(32-n)>) then
        ttbr = TTBR0;
        disabled = (TTBCR.PD0 == '1');
    else
        ttbr = TTBR1;
        disabled = (TTBCR.PD1 == '1');
        n = 0;  // TTBR1 translation always works like N=0 TTBR0 translation

    // Check this Translation Table Base Register is not disabled.
    if disabled then
        level = 1;
        result.addrdesc.fault = AArch32.TranslationFault(ipaddress, domain, level, acctype, iswrite,
                                                         secondstage, s2fs1walk);
        return result;

    // Obtain descriptor from initial lookup.
    l1descaddr.paddress.physicaladdress = ZeroExtend(ttbr<31:14-n>:vaddress<31-n:20>:'00');
    l1descaddr.paddress.NS = if IsSecure() then '0' else '1';
    IRGN = ttbr<0>:ttbr<6>;             // TTBR.IRGN
    RGN = ttbr<4:3>;                    // TTBR.RGN
    SH = ttbr<1>:ttbr<5>;               // TTBR.S:TTBR.NOS
    l1descaddr.memattrs = WalkAttrDecode(SH, RGN, IRGN);

    if !HaveEL(EL2) || IsSecure()  then
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    // if only 1 stage of translation
    l1descaddr2 = l1descaddr;
else
    l1descaddr2 = AArch32.SecondStageWalk(l1descaddr, vaddress, acctype, iswrite, 4);
    // Check for a fault on the stage 2 walk
    if IsFault(l1descaddr2) then
        result.addrdesc.fault = l1descaddr2.fault;
        return result;

// Update virtual address for abort functions
l1descaddr2.vaddress = ZeroExtend(vaddress);

l1desc = _Mem[l1descaddr2, 4, AccType_PTW];
if SCTLR.EE == '1' then l1desc = BigEndianReverse(l1desc);

// Process descriptor from initial lookup.
case l1desc<1:0> of
    when '00'                                                 // Fault, Reserved
        level = 1;
        result.addrdesc.fault = AArch32.TranslationFault(ipaddress, domain, level, acctype,
                                                         iswrite, secondstage, s2fs1walk);
        return result;

    when '01'                                                 // Large page or Small page
        domain = l1desc<8:5>;
        level = 2;
        pxn = l1desc<2>;
        NS = l1desc<3>;

        // Obtain descriptor from level 2 lookup.

### Translation table walk using the Long-descriptor translation table format for stage 1

The `TranslationTableWalkLD()` pseudocode function describes the translation table walk when the stage 1 translation tables use the Long-descriptor format. It calls the function described in *Stage 2 translation table walk* on page G4-4194 if necessary:

```
// AArch32.TranslationTableWalkLD()
// ================================
// Returns a result of a translation table walk using the Long-descriptor format
//
// Implementations might cache information from memory in any number of non-coherent TLB
// caching structures, and so avoid memory accesses that have been expressed in this
// pseudocode. The use of such TLBs is not expressed in this pseudocode.

TLBRecord AArch32.TranslationTableWalkLD(bits(40) ipaddress, bits(32) vaddress,
                                         AccType acctype, boolean iswrite, boolean secondstage,
                                         boolean s2fs1walk, integer size)
    if !secondstage then
        assert ELUsingAArch32(S1TranslationRegime());

        result.addrdesc.paddress.NS = '1';

    result.addrdesc.paddress.physicaladdress = ZeroExtend(outputaddress);
    result.addrdesc.fault = AArch32.NoFault();
    result.contiguous = contiguousbit == '1';

    return result;
```

This function calls the `ConvertAttrsHints()` pseudocode function that is defined in *Translation table walk using the Short-descriptor translation table format for stage 1* on page G4-4186.

The `S1AttrDecode()` pseudocode function uses the MAIR0 and MAIR1 registers to decode the Attr[2:0] value from a stage 1 translation table descriptor:

```
// AArch32.S1AttrDecode()
// ======================
// Converts the Stage 1 attribute fields, using the MAIR, to orthogonal
// attributes and hints.

MemoryAttributes AArch32.S1AttrDecode(bits(2) SH, bits(3) attr, AccType acctype)

    MemoryAttributes memattrs;

    if PSTATE.EL == EL2 then
        mair = HMAIR1:HMAIR0;
    else
        mair = MAIR1:MAIR0;
    index = 8 * UInt(attr);
    attrfield = mair<index+7:index>;

    if ((attrfield<7:4> != '0000' && attrfield<3:0> == '0000') ||
        (attrfield<7:4> == '0000' && attrfield<3:0> != 'xx00')) then
        // Reserved, maps to an allocated value
        (-, attrfield) = ConstrainUnpredictableBits();

    if attrfield<7:4> == '0000' then            // Device
        memattrs.type = MemType_Device;
        case attrfield<3:0> of
            when '0000'  memattrs.device = DeviceType_nGnRnE;
            when '0100'  memattrs.device = DeviceType_nGnRE;
            when '1000'  memattrs.device = DeviceType_nGRE;
            when '1100'  memattrs.device = DeviceType_GRE;
            otherwise    Unreachable();         // Reserved, handled above

    elsif attrfield<3:0> != '0000'  then        // Normal
        memattrs.type = MemType_Normal;
        memattrs.outer = LongConvertAttrsHints(attrfield<7:4>, acctype);
        memattrs.inner = LongConvertAttrsHints(attrfield<3:0>, acctype);
        memattrs.shareable = SH<1> == '1';
        memattrs.outershareable = SH == '10';

    else
        Unreachable();                          // Reserved, handled above

    return MemAttrDefaults(memattrs);
```

The `S2AttrDecode()` pseudocode function decodes the Attr[3:0] value from a stage 2 translation table descriptor:

```
// S2AttrDecode()
// ==============
// Converts the Stage 2 attribute fields into orthogonal attributes and hints

MemoryAttributes S2AttrDecode(bits(2) SH, bits(4) attr, AccType acctype)

    MemoryAttributes memattrs;
```

Non-Confidential - Beta

```
    if attr<3:2> == '00' then                    // Device
        mematttrs.type = MemType_Device;
        case attr<1:0> of
            when '00'  mematttrs.device = DeviceType_nGnRnE;
            when '01'  mematttrs.device = DeviceType_nGnRE;
            when '10'  mematttrs.device = DeviceType_nGRE;
            when '11'  mematttrs.device = DeviceType_GRE;

    elsif attr<1:0> != '00' then                // Normal
        mematttrs.type = MemType_Normal;
        mematttrs.outer = S2ConvertAttrsHints(attr<3:2>, acctype);
        mematttrs.inner = S2ConvertAttrsHints(attr<1:0>, acctype);
        mematttrs.shareable = SH<1> == '1';
        mematttrs.outershareable = SH == '10';

    else
        mematttrs = MemoryAttributes UNKNOWN;    // Reserved

    return MemAttrDefaults(mematttrs);
```

### Stage 2 translation table walk

In the Non-secure EL1&0 translation regime, a descriptor address returned by stage 1 lookup is in the IPA address space, and must be mapped to a PA by a stage 2 translation. When EL2 is using AArch32, function `AArch32.SecondStageWalk()` performs this translation, by calling the `AArch32.SecondStageTranslate()` function. When called from `AArch32.SecondStageWalk()`, the.`AArch32.SecondStageTranslate()` function performs a second stage translation, from IPA to PA, of the supplied address, including checking that the access has read permission at the second stage. If the access does not have second stage read permission it generates a second stage Permission fault on the first stage translation table walk. The second stage translation might hit in a TLB, or might involve a translation table walk, which will use the algorithm described in this section. Stage 2 translations tables always use the Long-descriptor translation table format.

```
// AArch32.SecondStageWalk()
// =========================
// Perform a stage 2 translation on a stage 1 translation page table walk access.

AddressDescriptor AArch32.SecondStageWalk(AddressDescriptor S1, bits(32) vaddress, AccType acctype,
                                          boolean iswrite, integer size)
    assert HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1};

    s2fs1walk = TRUE;
    wasaligned = TRUE;
    return AArch32.SecondStageTranslate(S1, vaddress, acctype, iswrite, wasaligned, s2fs1walk,
                                        size);
```

The `SecondStageTranslate()` pseudocode function performs the stage 2 translation table walk.

```
// AArch32.SecondStageTranslate()
// ==============================
// Perform a stage 2 translation walk. The function used by Address Translation operations is
// similar except it uses the translation regime specified for the instruction.

AddressDescriptor AArch32.SecondStageTranslate(AddressDescriptor S1, bits(32) vaddress,
                                               AccType acctype, boolean iswrite, boolean wasaligned,
                                               boolean s2fs1walk, integer size)
    assert HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1};
    assert IsZero(S1.paddress.physicaladdress<47:40>);

    if !ELUsingAArch32(EL2) then
        return AArch64.SecondStageTranslate(S1, ZeroExtend(vaddress, 64), acctype, iswrite,
                                            wasaligned, s2fs1walk, size);

    s2_enabled = HCR.VM == '1' || HCR.DC == '1';

### G4.19.7 Memory access decode when TEX remap is enabled

When using the Short-descriptor translation table format, the function `RemappedTEXDecode()` decodes the `texcb` and `S` attributes derived from the translation tables when TEX remap is enabled. *Short-descriptor format memory region attributes, with TEX remap* on page G4-4049 shows the interpretation of the arguments.

```
// AArch32.RemappedTEXDecode()
// ===========================

MemoryAttributes AArch32.RemappedTEXDecode(bits(3) TEX, bit C, bit B, bit S, AccType acctype)

    MemoryAttributes mematTrs;

    region = UInt(TEX<0>:C:B);         // TEX<2:1> are ignored in this mapping scheme
    if region == 6 then
        mematTrs = MemoryAttributes IMPLEMENTATION_DEFINED;
    else
        base = 2 * region;
        attrfield = PRRR<base+1:base>;

        if attrfield == '11' then      // Reserved, maps to allocated value
            (-, attrfield) = ConstrainUnpredictableBits();

        case attrfield of
            when '00'                  // Device-nGnRnE
                mematTrs.type = MemType_Device;
                mematTrs.device = DeviceType_nGnRnE;
            when '01'                  // Device-nGnRE
                mematTrs.type = MemType_Device;
                mematTrs.device = DeviceType_nGnRE;
            when '10'
                mematTrs.type = MemType_Normal;
                mematTrs.inner = ShortConvertAttrsHints(NMRR<base+1:base>, acctype);
                mematTrs.outer = ShortConvertAttrsHints(NMRR<base+17:base+16>, acctype);
                s_bit = if S == '0' then PRRR.NS0 else PRRR.NS1;
                mematTrs.shareable = (s_bit == '1');
                mematTrs.outershareable = (s_bit == '1' && PRRR<region+24> == '0');
            when '11'
                Unreachable();

    // transient bits are not supported in this format
    mematTrs.inner.transient = FALSE;
    mematTrs.outer.transient = FALSE;

    return MemAttrDefaults(mematTrs);
```

# Chapter G5
# The Generic Timer in AArch32 state

This chapter describes the implementation of the ARM Generic Timer as an extension to an ARMv8 implementation. It includes an overview of the AArch32 System register interface to an ARM Generic Timer.

It contains the following section:

- *About the Generic Timer in AArch32 state* on page G5-4202.

Chapter D6 *The Generic Timer in AArch64 state* describes the AArch64 view of the Generic Timer, including an additional timer that can be implemented in AArch64 state, and Chapter I1 *System Level Implementation of the Generic Timer* describes the system level implementation of the Generic Timer.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## G5.1 About the Generic Timer in AArch32 state

Figure G5-1 shows an example system-on-chip that uses the Generic Timer as a system timer. In this figure:

- This manual defines the architecture of the individual PEs in the multiprocessor blocks.
- The *ARM Generic Interrupt Controller Architecture Specification* defines a possible architecture for the interrupt controllers.
- Generic Timer functionality is distributed across multiple components.

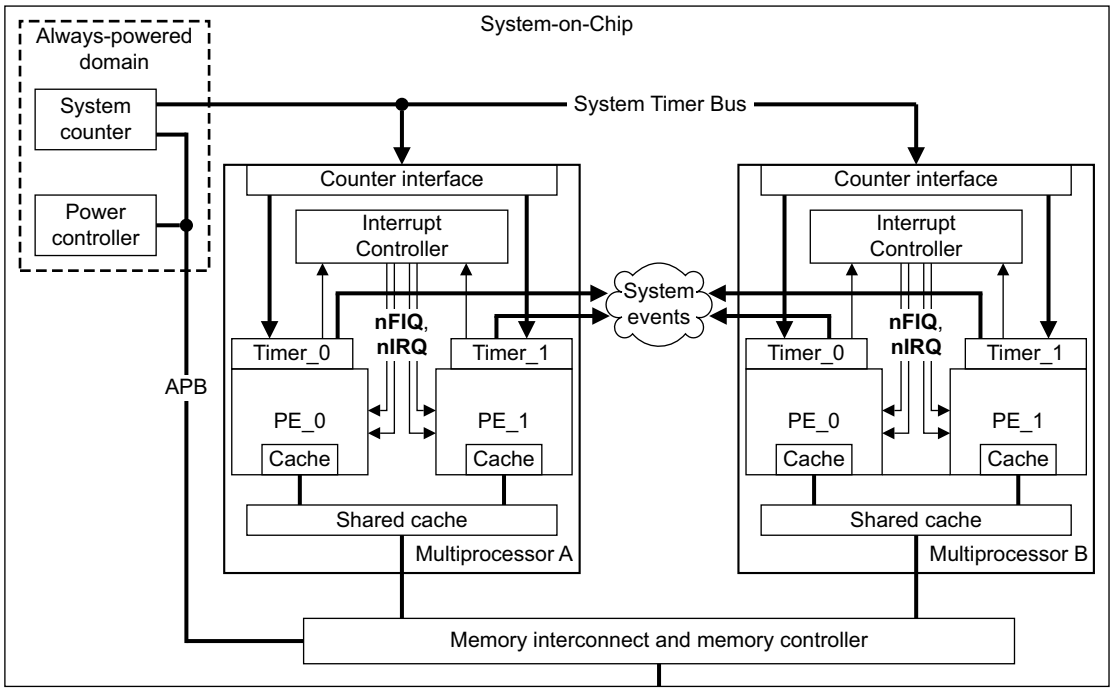

**Figure G5-1 Generic Timer example**

The Generic Timer:

- Provides a system counter, that measures the passing of time in real-time.

  **Note**

  The Generic Timer can also provide other components at a system level, but Figure G5-1 does not show any such components.

- Supports *virtual counters* that measure the passing of virtual-time. That is, a virtual counter can measure the passing of time on a particular virtual machine.
- Timers, that can trigger events after a period of time has passed. The timers:
  - Can be used as count-up or as count-down timers.
  - Can operate in real-time or in virtual-time.

This chapter describes an instance of the Generic Timer component that Figure G5-1 shows as Timer_0 or Timer_1 within the Multiprocessor A or Multiprocessor B block. This component can be accessed from AArch64 state or AArch32 state, and this chapter describes access from AArch32 state. Chapter D6 *The Generic Timer in AArch64 state* describes access to this component from AArch64 state.

**Note**

The reset requirements of Generic Timer registers are more strict when they are accessed from AArch32 state than when they are accessed from AArch64 state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

A Generic Timer implementation must also include a memory-mapped system component. This component:

- Must provide the System counter shown in Figure G5-1 on page G5-4202.
- Optionally, can provide timer components for use at a system level.

Chapter I1 *System Level Implementation of the Generic Timer* describes this memory-mapped component.

### G5.1.1 System counter

The Generic Timer provides a system counter with the following specification:

| | |
|---|---|
| **Width** | At least 56 bits wide. |
| | The value returned by any 64-bit read of the counter is zero-extended to 64 bits. |
| **Frequency** | Increments at a fixed frequency, typically in the range 1-50MHz. |
| | Can support one or more alternative operating modes in which it increments by larger amounts at a lower frequency, typically for power-saving. |
| **Roll-over** | Roll-over time of not less than 40 years. |
| **Accuracy** | ARM does not specify a required accuracy, but recommends that the counter does not gain or lose more than ten seconds in a 24-hour period. |
| | Use of lower-frequency modes must not affect the implemented accuracy. |
| **Start-up** | Starts operating from zero. |

The system counter must provide a uniform view of system time. More precisely, it must be impossible for the following sequence of events to show system time going backwards:

1. Device A reads the time from the system counter.
2. Device A communicates with another agent in the system, Device B.
3. After recognizing the communication from Device A, Device B reads the time from the system counter.

The system counter must be implemented in an always-on power domain.

To support lower-power operating modes, the counter can increment by larger amounts at a lower frequency. For example, a 10MHz system counter might either increment:

- By 1 at 10MHz.
- By 500 at 20kHz, when the system lowers the clock frequency, to reduce power consumption.

In this case, the counter must support transitions between high-frequency, high-precision operation, and lower-frequency, lower-precision operation, without any impact on the required accuracy of the counter.

The CNTFRQ register is intended to hold a copy of the current clock frequency to allow fast reference to this frequency by software running on the PE. For more information see *Initializing and reading the system counter frequency*.

The mechanism by which the count from the system counter is distributed to system components is IMPLEMENTATION DEFINED, but each PE with a System register interface to the system counter must have a counter input that can capture each increment of the counter.

**Note**

So that the system counter can be clocked independently from the PE hardware, the count value might be distributed using a Gray code sequence. *Gray-count scheme for timer distribution scheme* on page I1-5110 gives more information about this possibility.

#### Initializing and reading the system counter frequency

The CNTFRQ register must be programmed to the clock frequency of the system counter. Typically, this is done only during the system boot process, by using the System register interface to write the system counter frequency to the CNTFRQ register. Only software executing at the highest implemented Exception level can write to CNTFRQ.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

The CNTFRQ register is UNKNOWN at reset, and therefore the counter frequency must be set as part of the system boot process.

Software can read the CNTFRQ register, to determine the current system counter frequency, in the following states and modes:

- Hyp mode.
- Secure and Non-secure PL1 modes.
- When CNTKCTL.PL0PCTEN is set to 1, Secure and Non-secure PL0 modes.

#### Memory-mapped controls of the system counter

Some system counter controls are accessible only through the memory-mapped interface to the system counter. These controls are:

- Enabling and disabling the counter.
- Setting the counter value.
- Changing the operating mode, to change the update frequency and increment value.
- Enabling Halt-on-debug, that a debugger can then use to suspend counting.

For descriptions of these controls, see Chapter I1 *System Level Implementation of the Generic Timer*.

### G5.1.2 The physical counter

The PE includes a physical counter that contains the count value of the system counter. The CNTPCT register holds the current physical counter value.

#### Accessing the physical counter

Software with sufficient privilege can read CNTPCT using a 64-bit System register read.

CNTPCT:

- Is always accessible from Secure PL1 modes and from Non-secure Hyp mode.
- Is accessible from Non-secure PL1 modes when the value of CNTHCTL.PL1PCTEN is 1. When the value of CNTHCTL.PL1PCTEN is 0, any attempt to access CNTPCT from Non-secure PL1 modes is trapped to Hyp mode.
- Is accessible from Secure User mode when the value of CNTKCTL.PL0PCTEN is 1. When the value of CNTKCTL.PL0PCTEN is 0, any attempt to access CNTPCT generates an UNDEFINED exception.
- Is accessible from Non-secure User mode when the value of CNTHCTL.PL1PCTEN is 1 and the value of CNTKCTL.PL0PCTEN is 1. Otherwise:
  - When the value of CNTKCTL.PL0PCTEN is 0, any attempt to access CNTPCT from Non-secure User mode generates an UNDEFINED exception.
  - When the value of CNTKCTL.PL0PCTEN is 1 and the value of CNTHCTL.PL1PCTEN is 0, any attempt to access CNTPCT from Non-secure User mode is trapped to Hyp mode.

Reads of CNTPCT can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that CNTPCT must be read, an ISB must be used to ensure that the read of CNTPCT occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to read the timer
    LDR R1, [R2]
    CMP R1, #1
    BNE loop
    ISB             ; without this, the CNTPCT could be read before the memory location in [R2]
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
                ; has had the value 1 written to it
    MRS R1, CNTPCT
```

### G5.1.3 The virtual counter

An implementation of the Generic Timer always includes a virtual counter, that indicates virtual time.

The virtual counter contains the value of the physical counter minus a 64-bit virtual offset. When executing in a Non-secure PL1 or PL0 mode, the virtual offset value relates to the current virtual machine.

The CNTVOFF register contains the virtual offset. CNTVOFF is only accessible:

- From Hyp mode.
- From Monitor mode only when SCR.NS is set to 1.

For more information see *Status of the CNTVOFF register*.

The CNTVCT register holds the current virtual counter value.

#### Accessing the virtual counter

Software with sufficient privilege can read CNTVCT using a 64-bit System register read.

CNTVCT is always accessible from Secure PL1 modes and from Non-secure PL1 and PL2 modes.

In addition, when CNTKCTL.PL0VCTEN is set to 1, CNTVCT is accessible from PL0.

When CNTKCTL.PL0VCTEN is set to 0, any attempt to access CNTVCT from PL0 is UNDEFINED.

Reads of CNTVCT can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that CNTVCT must be read, an ISB must be used to ensure that the read of CNTVCT occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to read the timer
    LDR R1, [R2]
    CMP R1, #1
    BNE loop
    ISB             ; without this, the CNTVCT could be read before the memory location in [R2]
                    ; has had the value 1 written to it
    MRS R1, CNTVCT
```

### G5.1.4 Status of the CNTVOFF register

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the *virtual offset* between the physical count and the virtual count. CNTVOFF is only accessible at EL2 or above. If EL2 is not implemented, the virtual counter uses a fixed virtual offset of zero.

### G5.1.5 Event streams

Any implementation of the Generic Timer can use the system counter to generate one or more *event streams*, to generate periodic wake-up events as part of the mechanism described in *Wait for Event mechanism and Send event on page D1-1611*.

**Note**

An event stream might be used:

- To impose a time-out on a Wait For Event polling loop.
- To safeguard against any programming error that means an expected event is not generated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

An event stream is configured by:

- Selecting which bit, from the bottom 16 bits of a counter, triggers the event. This determines the frequency of the events in the stream.
- Selecting whether the event is generated on each 0 to 1 transition, or each 1 to 0 transition, of the selected counter bit.

The CNTKCTL.{EVNTEN, EVNTDIR, EVNTI} fields define an event stream that is generated from the virtual counter.

In all implementations the CNTHCTL.{EVNTEN, EVNTDIR, EVNTI} fields define an event stream that is generated from the physical counter.

The operation of an event stream is as follows:

- The pseudocode variables `PreviousCNTVCT` and `PreviousCNTPCT` are initialized as:

```
// Variables used for generation of the timer event stream.
bits(64) PreviousCNTVCT = bits(64) UNKNOWN;
bits(64) PreviousCNTPCT = bits(64) UNKNOWN;
```

- The pseudocode functions `TestEventCNTV()` and `TestEventCNTP()` are called on each cycle of the PE clock.
- The `TestEventCNTx()` pseudocode template defines the functions `TestEventCNTV()` and `TestEventCNTP()`:

```
// TestEventCNTx()
// ===============

// Template for the TestEventCNTV() and TestEventCNTP() functions
// Describes operation when all Exception Levels are using AArch32:
//   CNTxCT         is  CNTVCT          or  CNTPCT          64-bit count value
//   CNTx_CTL       is  CNTV_CTL        or  CNTP_CTL        Control register
//   PreviousCNTxCT is  PreviousCNTVCT  or  PreviousCNTPCT

TestEventCNTx()
    if CNTx_CTL.EVNTEN == '1' then
        n = UInt(CNTx_CTL.EVNTI);
        SampleBit   = CNTxCT<n>;
        PreviousBit = PreviousCNTxCT<n>;

        if CNTx_CTL.EVNTDIR == '0' then
            if PreviousBit == '0' && SampleBit == '1' then EventRegisterSet();
        else
            if PreviousBit == '1' && SampleBit == '0' then EventRegisterSet();

    PreviousCNTxCT = CNTxCT;

    return;
```

### G5.1.6 Timers

In an implementation that includes EL3, in any implementation of the Generic Timer, the following timers are accessible from AArch32 state, provided the appropriate Exception level can use AArch32:

- A Non-secure EL1 physical timer. A Non-secure EL1 control determines whether this register is accessible from Non-secure EL0.
- A Secure PL1 physical timer. This timer:
  - Is accessible from Secure EL1 using AArch32 when EL3 is using AArch64.
  - Is accessible from Secure EL3 when EL3 is using AArch32.

  A Secure PL1 control determines whether this register is accessible from Secure EL0.
- A Non-secure EL2 physical timer.
- A virtual timer.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The output of each implemented timer:

- Provides an output signal to the system.
- If the PE interfaces to a *Generic Interrupt Controller* (GIC), signals a *Private Peripheral Interrupt* (PPI) to that GIC. In a multiprocessor implementation, each PE must use the same interrupt number for each timer.

Each timer is implemented as three registers:

- A 64-bit CompareValue register, that provides a 64-bit unsigned upcounter.
- A 32-bit TimerValue register, that provides a 32-bit signed downcounter.
- A 32-bit Control register.

In all implementations, the AArch32 System registers for the EL1 (or PL1) physical timer are Banked, to provide the Secure and Non-secure implementations of the timer. Table G5-1 shows the Timer registers.

**Table G5-1 Timer registers summary for the Generic Timer**

| Timer register | Secure PL1/Non-secure EL1 physical timer | PL2 physical timer | Virtual timer |
|---|---|---|---|
| CompareValue register | CNTP_CVAL[a] | CNTHP_CVAL | CNTV_CVAL |
| TimerValue register | CNTP_TVAL[a] | CNTHP_TVAL | CNTV_TVAL |
| Control register | CNTP_CTL[a] | CNTHP_CTL | CNTV_CTL |

a. In AArch32 state, these registers are Banked to provide the Non-secure EL1 physical timer and the Secure PL1 physical timer.

The following sections describe:

- *Accessing the timer registers*
- *Operation of the CompareValue views of the timers* on page G5-4208
- *Operation of the TimerValue views of the timers* on page G5-4209.

## Accessing the timer registers

For each timer, all timer registers have the same access permissions, as follows:

**Secure PL1 and Non-secure EL1 physical timer**

Accessible from PL1 modes, except that Non-secure software executing at EL2 controls access from Non-secure EL1 modes.

When access from PL1 modes is permitted, CNTKCTL.PL0PTEN determines whether the registers are accessible from EL0. If an access is not permitted because CNTKCTL.PL0PTEN is set to 0, an attempted access from EL0 is UNDEFINED.

In all implementations:

- Except for accesses from Monitor mode, accesses are to the registers for the current Security state.
- For accesses from Monitor mode, the value of SCR_EL3.NS determines whether accesses are to the Secure or the Non-secure registers.
- The Non-secure registers are accessible from Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- CNTHCTL.PL1PCEN determines whether the Non-secure registers are accessible from Non-secure EL1 modes. If this bit is set to 1, to enable access from Non-secure EL1 modes, CNTKCTL.PL0PTEN determines whether the registers are accessible from Non-secure EL0.

  If an access is not permitted because CNTHCTL.PL1PCEN is set to 0, an attempted access from a Non-secure EL1 or EL0 mode generates a Hyp Trap exception. However, if CNTKCTL.PL0PTEN is set to 0, this control takes priority, and an attempted access from EL0 is UNDEFINED.

**EL2 physical timer** Accessible from Hyp mode, and from Secure Monitor mode when SCR_EL3.NS is set to 1.

**Virtual timer** Accessible from Secure and Non-secure PL1 modes, and from Hyp mode.

CNTKCTL.PL0VTEN determines whether the registers are accessible from EL0 modes. If an access is not permitted because CNTKCTL.PL0VTEN is set to 0, an attempted access from EL0 is UNDEFINED.

### Operation of the CompareValue views of the timers

The CompareValue view of a timer operates as a 64-bit upcounter. The timer triggers when the appropriate counter reaches the value programmed into a CompareValue register. When the timer triggers, it generates an interrupt if the interrupt is enabled in the corresponding timer control register, CNTP_CTL, CNTHP_CTL, or CNTV_CTL. For CNTP_CTL, it is the interrupt asserted by the Non-secure instance of the register that is the same as the interrupt asserted by CNTP_CTL_EL0.

The operation of this view of a timer is:

```
EventTriggered = (((Counter[63:0] - Offset[63:0])[63:0] - CompareValue[63:0]) >= 0)
```

Where:

`EventTriggered` Is TRUE if the event for this timer must be triggered, and FALSE otherwise.

`Counter` The physical counter value, that can be read from the CNTPCT register.

**Note**

The virtual counter value, that can be read from the CNTVCT register, is the value:

```
(Counter - Offset)
```

`Offset` For a physical timer it is zero, and for the virtual timer it is the virtual offset, held in the CNTVOFF register.

`CompareValue` The value of the appropriate CompareValue register, CNTP_CVAL, CNTHP_CVAL, or CNTV_CVAL.

In this view of a timer, `Counter`, `Offset`, and `CompareValue` are all 64-bit unsigned values.

**Note**

This means that a timer with a `CompareValue` of, or close to, `0xFFFF_FFFF_FFFF_FFFF` might never trigger. However, there is no practical requirement to use values close to the counter wrap value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation of the TimerValue views of the timers

The TimerValue view of a timer operates as a signed 32-bit downcounter. A TimerValue register is programmed with a count value. This value decrements on each increment of the appropriate counter, and the timer triggers when the value reaches zero. When the timer triggers, it generates an interrupt if the interrupt is enabled in the corresponding timer control register, CNTP_CTL, CNTHP_CTL, or CNTV_CTL.

This view of a timer depends on the following behavior of accesses to TimerValue registers:

**Reads** `TimerValue = (CompareValue - (Counter - Offset))[31:0]`

**Writes** `CompareValue = ((Counter - Offset)[63:0] + SignExtend(TimerValue))[63:0]`

Where the arguments have the definitions used in *Operation of the CompareValue views of the timers* on page G5-4208, and in addition:

`TimerValue` The value of a TimerValue register, CNTP_TVAL, CNTHP_TVAL, or CNTV_TVAL.

In this view of a timer, all values are signed, in standard two's complement form.

After an event has triggered, a read of a TimerValue register indicates the time since the event triggered.

**Note**

- *Operation of the CompareValue views of the timers* on page G5-4208 gives a strict definition of EventTriggered. However, provided that the TimerValue is not expected to wrap as a 32-bit signed value when decremented from `0x80000000`, the TimerValue view can be used as giving an effect equivalent to:

  `EventTriggered = (TimerValue ≤ 0)`

- Programming TimerValue to a negative number with magnitude greater than (Counter−Offset) can lead to an arithmetic overflow that causes the CompareValue to be an extremely large positive value. This potentially delays the resultant interrupt for an extremely long period of time.

# Chapter G6
# AArch32 System Register Descriptions

This chapter describes each of the AArch32 System registers.

It contains the following sections:

- *About the AArch32 System registers* on page G6-4212.
- *General system control registers* on page G6-4213.
- *Debug registers* on page G6-4648.
- *Performance Monitors registers* on page G6-4737.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## G6.1 About the AArch32 System registers

For general information about the AArch32 System registers, see:

- *About the System registers for VMSAv8-32* on page G4-4116.
- *Organization of the CP14 registers in VMSAv8-32* on page G4-4138.
- *Organization of the CP15 registers in VMSAv8-32* on page G4-4141.
- *Functional grouping of VMSAv8-32 System registers* on page G4-4161.

The remainder of this chapter describes the AArch32 System registers, in the following sections:

- *General system control registers* on page G6-4213.
- *Debug registers* on page G6-4648.
- *Performance Monitors registers* on page G6-4737.
- *Generic Timer registers* on page G6-4780.

Non-Confidential - Beta

## G6.2 General system control registers

This section lists the System registers in AArch32 that are not part of one of the other listed groups.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.1 ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

ACTLR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

ACTLR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

ACTLR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TAC==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HCR_EL2.TACR==1, Non-secure EL1 accesses to this register are trapped to EL2 using AArch64.

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

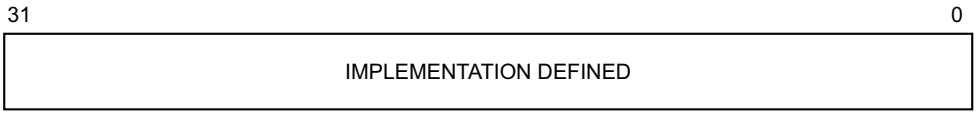
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register ACTLR is architecturally mapped to AArch64 System register ACTLR_EL1[31:0].

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

ACTLR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The ACTLR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

### Accessing the ACTLR:

To access the ACTLR:

```
MRC p15,0,<Rt>,c1,c0,1 ; Read ACTLR into Rt
MCR p15,0,<Rt>,c1,c0,1 ; Write Rt to ACTLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.2 ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

**Purpose**

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

ACTLR2(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

ACTLR2(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

ACTLR2 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TAC==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HCR_EL2.TACR==1, Non-secure EL1 accesses to this register are trapped to EL2 using AArch64.

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

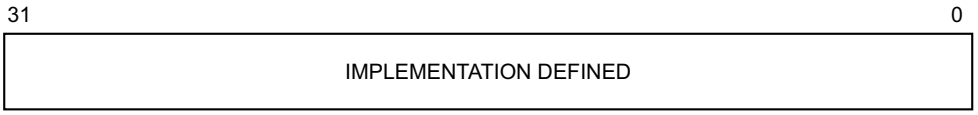
**Configurations**

AArch32 System register ACTLR2 is architecturally mapped to AArch64 System register ACTLR_EL1[63:32].

It is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed.

The implementation of this register can be detected by examining bits [7:4] of the ID_MMFR4/ID_MMFR4_EL1 register.

RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

ACTLR2 is a 32-bit register.

## Field descriptions

The ACTLR2 bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the ACTLR2:

To access the ACTLR2:

```
MRC p15,0,<Rt>,c1,c0,3 ; Read ACTLR2 into Rt
MCR p15,0,<Rt>,c1,c0,3 ; Write Rt to ACTLR2
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0000 | 011 |

### G6.2.3 ADFSR, Auxiliary Data Fault Status Register

The ADFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for Data Abort exceptions taken to EL1 modes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

ADFSR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

ADFSR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

ADFSR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

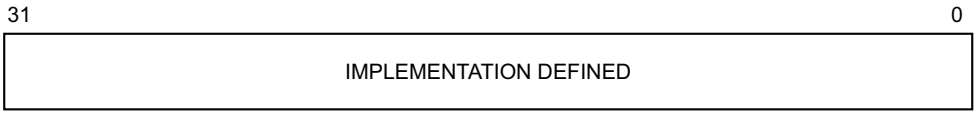
If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register ADFSR is architecturally mapped to AArch64 System register AFSR0_EL1.

If EL3 is implemented and is using AArch32, this register also provides fault status information for Data Abort exceptions taken to EL3 modes.

RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

ADFSR is a 32-bit register.

## Field descriptions

The ADFSR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the ADFSR:

To access the ADFSR:

```
MRC p15,0,<Rt>,c5,c1,0 ; Read ADFSR into Rt
MCR p15,0,<Rt>,c5,c1,0 ; Write Rt to ADFSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0101 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.4 AIDR, Auxiliary ID Register

The AIDR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED identification information.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

The value of this register must be used in conjunction with the value of MIDR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID1==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID1==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register AIDR is architecturally mapped to AArch64 System register AIDR_EL1.

**Attributes**

AIDR is a 32-bit register.

#### Field descriptions

The AIDR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

Non-Confidential - Beta

### Accessing the AIDR:

To access the AIDR:

```
MRC p15,1,<Rt>,c0,c0,7 ; Read AIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 001 | 0000 | 0000 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.5 AIFSR, Auxiliary Instruction Fault Status Register

The AIFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for Prefetch Abort exceptions taken to EL1 modes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

AIFSR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

AIFSR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

AIFSR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

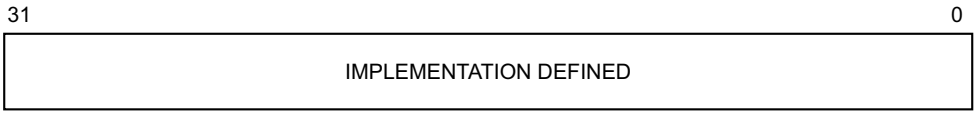
If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register AIFSR is architecturally mapped to AArch64 System register AFSR1_EL1.

If EL3 is implemented and is using AArch32, this register also provides fault status information for Data Abort exceptions taken to EL3 modes.

RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

AIFSR is a 32-bit register.

## Field descriptions

The AIFSR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the AIFSR:

To access the AIFSR:

```
MRC p15,0,<Rt>,c5,c1,1 ; Read AIFSR into Rt
MCR p15,0,<Rt>,c5,c1,1 ; Write Rt to AIFSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0101 | 0001 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.6 AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR0.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

AMAIR0(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

AMAIR0(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

AMAIR0 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

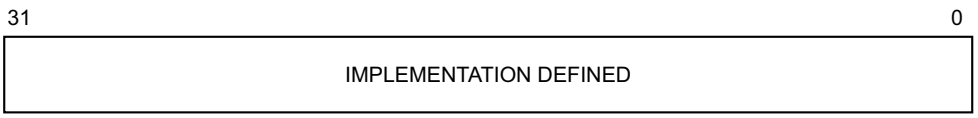
If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register AMAIR0 is architecturally mapped to AArch64 System register AMAIR_EL1[31:0].

When EL3 is using AArch32, write access to AMAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMAIR0 is a 32-bit register.

## Field descriptions

The AMAIR0 bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the AMAIR0:

To access the AMAIR0:

```
MRC p15,0,<Rt>,c10,c3,0 ; Read AMAIR0 into Rt
MCR p15,0,<Rt>,c10,c3,0 ; Write Rt to AMAIR0
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1010 | 0011 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.7 AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

AMAIR1(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

AMAIR1(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

AMAIR1 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

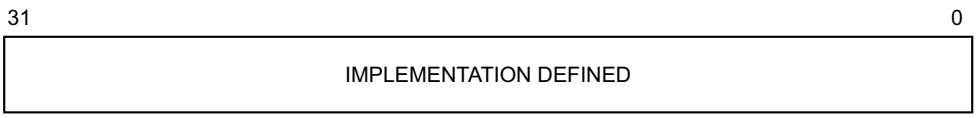
If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register AMAIR1 is architecturally mapped to AArch64 System register AMAIR_EL1[63:32].

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMAIR1 is a 32-bit register.

## Field descriptions

The AMAIR1 bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the AMAIR1:

To access the AMAIR1:

```
MRC p15,0,<Rt>,c10,c3,1 ; Read AMAIR1 into Rt
MCR p15,0,<Rt>,c10,c3,1 ; Write Rt to AMAIR1
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1010 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.8 APSR, Application Program Status Register

The APSR characteristics are:

**Purpose**

Hold program status and control information.

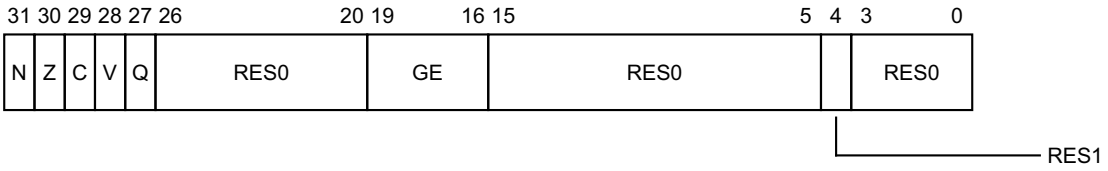
**Usage constraints**

The APSR can be read using the MRS instruction and written using the MSR (immediate) or MSR (register) instructions. For more details on the instruction syntax, see *PSTATE and banked register access instructions* on page F1-2420.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

APSR is a 32-bit register.

## Field descriptions

The APSR bit assignments are:

**N, bit [31]**

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:20]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**Bits [15:5]**

Reserved, RES0.

**Bit [4]**

Reserved, RES1.

**Bits [3:0]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.9 ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read

The ATS12NSOPR characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If EL3 is implemented and is using AArch64, execution of ATS12NSOPR in Secure EL1 using AArch32 is trapped as an exception to EL3.

**Traps and Enables**

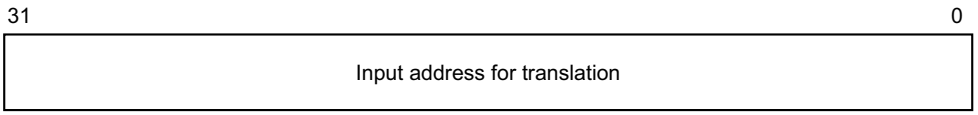
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS12NSOPR is a 32-bit system operation.

#### Field descriptions

The ATS12NSOPR input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the ATS12NSOPR operation:

To perform the ATS12NSOPR operation:

```
MCR p15,0,<Rt>,c7,c8,4 ; ATS12NSOPR operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1000 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.10 ATS12NSOPW, Address Translate Stages 1 and 2 Non-secure Only PL1 Write

The ATS12NSOPW characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if writing to the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If EL3 is implemented and is using AArch64, execution of ATS12NSOPW in Secure EL1 using AArch32 is trapped as an exception to EL3.

**Traps and Enables**

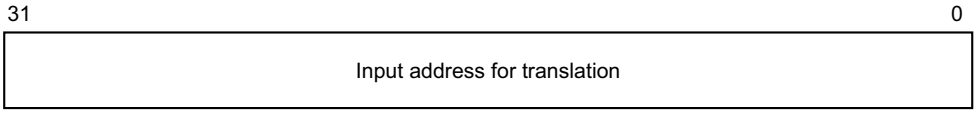
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS12NSOPW is a 32-bit system operation.

#### Field descriptions

The ATS12NSOPW input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the ATS12NSOPW operation:

To perform the ATS12NSOPW operation:

```
MCR p15,0,<Rt>,c7,c8,5 ; ATS12NSOPW operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1000 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.11 ATS12NSOUR, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read

The ATS12NSOUR characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if reading from the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If EL3 is implemented and is using AArch64, execution of ATS12NSOUR in Secure EL1 using AArch32 is trapped as an exception to EL3.

**Traps and Enables**

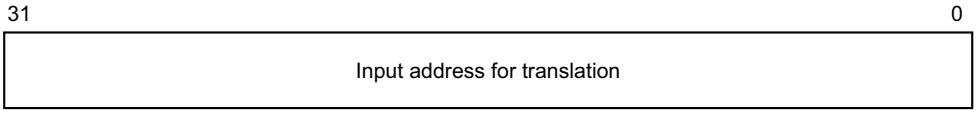
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS12NSOUR is a 32-bit system operation.

#### Field descriptions

The ATS12NSOUR input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the ATS12NSOUR operation:

To perform the ATS12NSOUR operation:

```
MCR p15,0,<Rt>,c7,c8,6 ; ATS12NSOUR operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1000 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.12 ATS12NSOUW, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write

The ATS12NSOUW characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if writing to the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If EL3 is implemented and is using AArch64, execution of ATS12NSOUW in Secure EL1 using AArch32 is trapped as an exception to EL3.

**Traps and Enables**

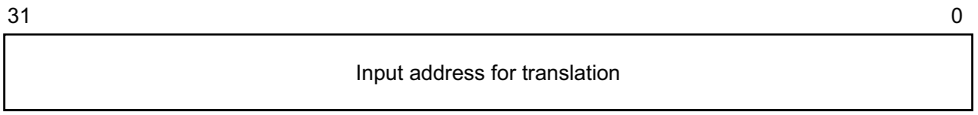
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS12NSOUW is a 32-bit system operation.

## Field descriptions

The ATS12NSOUW input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

### G6.2.13 ATS1CPR, Address Translate Stage 1 Current state PL1 Read

The ATS1CPR characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if reading from the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

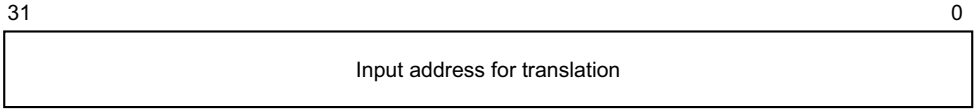
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS1CPR is a 32-bit system operation.

#### Field descriptions

The ATS1CPR input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### G6.2.14 ATS1CPW, Address Translate Stage 1 Current state PL1 Write

The ATS1CPW characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if writing to the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

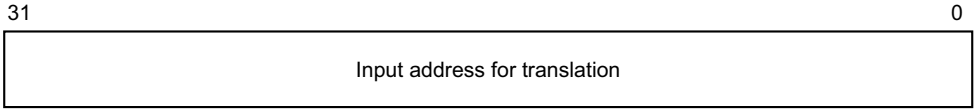
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS1CPW is a 32-bit system operation.

#### Field descriptions

The ATS1CPW input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### G6.2.15 ATS1CUR, Address Translate Stage 1 Current state Unprivileged Read

The ATS1CUR characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if reading from the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

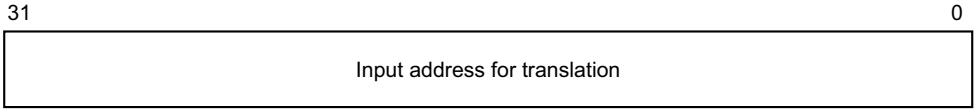
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS1CUR is a 32-bit system operation.

#### Field descriptions

The ATS1CUR input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### G6.2.16 ATS1CUW, Address Translate Stage 1 Current state Unprivileged Write

The ATS1CUW characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if writing to the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

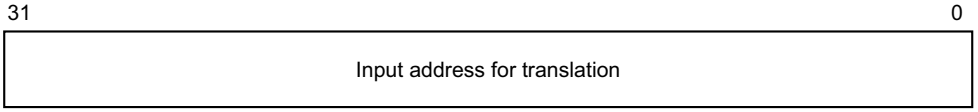
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS1CUW is a 32-bit system operation.

## Field descriptions

The ATS1CUW input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### G6.2.17 ATS1HR, Address Translate Stage 1 Hyp mode Read

The ATS1HR characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if reading from the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode VA to PA address translation instructions* on page K1-5499.

**Traps and Enables**

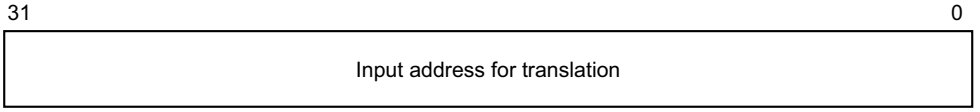
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS1HR is a 32-bit system operation.

#### Field descriptions

The ATS1HR input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

### Performing the ATS1HR operation:

To perform the ATS1HR operation:

```
MCR p15,4,<Rt>,c7,c8,0 ; ATS1HR operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0111 | 1000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.18 ATS1HW, Address Translate Stage 1 Hyp mode Write

The ATS1HW characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if writing to the given virtual address.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode VA to PA address translation instructions* on page K1-5499.

**Traps and Enables**

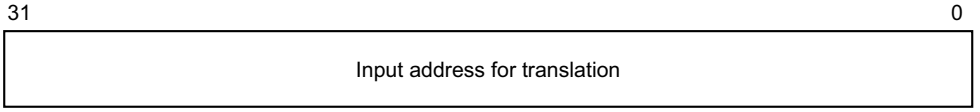
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ATS1HW is a 32-bit system operation.

#### Field descriptions

The ATS1HW input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

### Performing the ATS1HW operation:

To perform the ATS1HW operation:

```
MCR p15,4,<Rt>,c7,c8,1 ; ATS1HW operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0111 | 1000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.19 BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

**Purpose**

Invalidate all entries from branch predictors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

BPIALL is a 32-bit system operation.

#### Field descriptions

The BPIALL operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the BPIALL operation:

To perform the BPIALL operation:

```
MCR p15,0,<Rt>,c7,c5,6 ; BPIALL operation, ignoring the value in Rt
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0101 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.20 BPIALLIS, Branch Predictor Invalidate All, Inner Shareable

The BPIALLIS characteristics are:

**Purpose**

Invalidate all entries from branch predictors Inner Shareable.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

BPIALLIS is a 32-bit system operation.

#### Field descriptions

The BPIALLIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the BPIALLIS operation:

To perform the BPIALLIS operation:

```
MCR p15,0,<Rt>,c7,c1,6 ; BPIALLIS operation, ignoring the value in Rt
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0001 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.21 BPIMVA, Branch Predictor Invalidate by VA

The BPIMVA characteristics are:

**Purpose**

Invalidate virtual address from branch predictors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

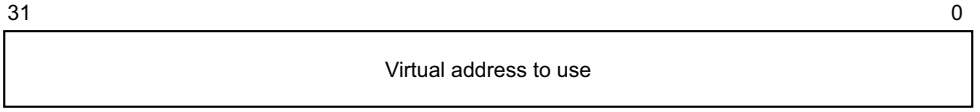
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

BPIMVA is a 32-bit system operation.

### Field descriptions

The BPIMVA input value bit assignments are:

**Bits [31:0]**

Virtual address to use.

### Performing the BPIMVA operation:

To perform the BPIMVA operation:

```
MCR p15,0,<Rt>,c7,c5,7 ; BPIMVA operation
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0101 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.22 CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

If CSSELR.Level indicates a cache that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID2==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID2==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

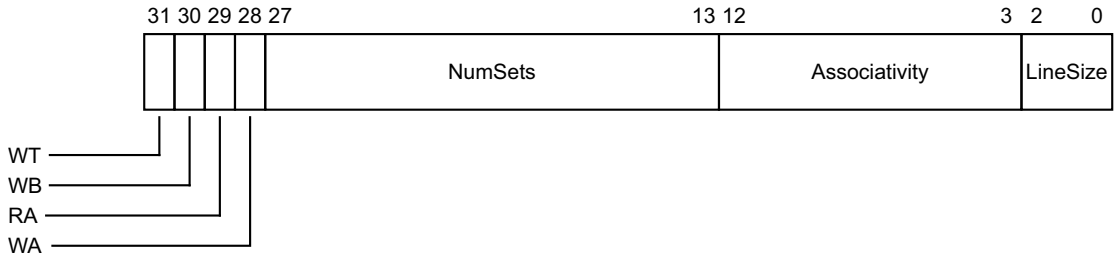
If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CCSIDR is architecturally mapped to AArch64 System register CCSIDR_EL1.

The implementation includes one CCSIDR for each cache that it can access. CSSELR and the Security state select which Cache Size ID Register is accessible.



**Attributes**

CCSIDR is a 32-bit register.

#### Field descriptions

The CCSIDR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**WT, bit [31]**

Indicates whether the selected cache level supports write-through. Permitted values are:

0 Write-through not supported.

1 Write-through supported.

**WB, bit [30]**

Indicates whether the selected cache level supports write-back. Permitted values are:

0 Write-back not supported.

1 Write-back supported.

**RA, bit [29]**

Indicates whether the selected cache level supports read-allocation. Permitted values are:

0 Read-allocation not supported.

1 Read-allocation supported.

**WA, bit [28]**

Indicates whether the selected cache level supports write-allocation. Permitted values are:

0 Write-allocation not supported.

1 Write-allocation supported.

**NumSets, bits [27:13]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Associativity, bits [12:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

($Log_2$(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

## Accessing the CCSIDR:

To access the CCSIDR:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p15,1,<Rt>,c0,c0,0 ; Read CCSIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 001 | 0000 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.23 CLIDR, Cache Level ID Register

The CLIDR characteristics are:

**Purpose**

Identifies the type of cache, or caches, implemented at each level, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID2==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

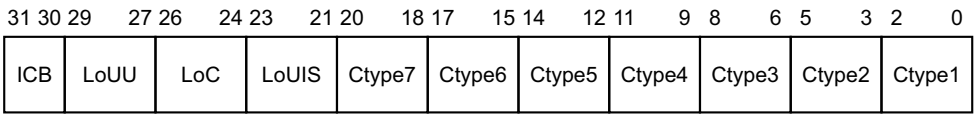
If HCR_EL2.TID2==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register CLIDR is architecturally mapped to AArch64 System register CLIDR_EL1.

**Attributes**

CLIDR is a 32-bit register.

### Field descriptions

The CLIDR bit assignments are:

**ICB, bits [31:30]**

Inner cache boundary. This field indicates the boundary between the inner and the outer domain.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The possible values are:

`00` Not disclosed in this mechanism.

`01` L1 cache is the highest inner level.

`10` L2 cache is the highest inner level.

`11` L3 cache is the highest inner level.

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.

**LoUIS, bits [23:21]**

Level of Unification Inner Shareable for the cache hierarchy.

**Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7**

Cache Type fields. Indicate the type of cache implemented at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

`000` No cache.

`001` Instruction cache only.

`010` Data cache only.

`011` Separate instruction and data caches.

`100` Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of `000`, no caches exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of `000`, the values of Ctype4 to Ctype7 must be ignored.

### Accessing the CLIDR:

To access the CLIDR:

```
MRC p15,1,<Rt>,c0,c0,1 ; Read CLIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 001 | 0000 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.24 CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

**Purpose**

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CONTEXTIDR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

CONTEXTIDR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CONTEXTIDR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T13==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL1 accesses to this register are trapped to EL2.

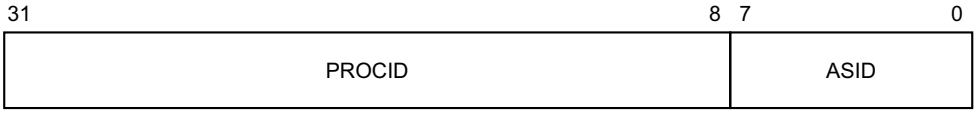
**Configurations**

AArch32 System register CONTEXTIDR is architecturally mapped to AArch64 System register CONTEXTIDR_EL1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

RW fields in this register reset to architecturally UNKNOWN values.



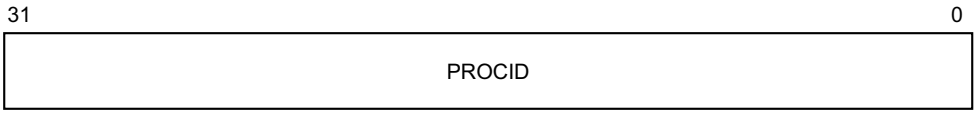
**Attributes**

CONTEXTIDR is a 32-bit register.

## Field descriptions

The CONTEXTIDR bit assignments are:

***When TTBCR.EAE==0:***



**PROCID, bits [31:8]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

**ASID, bits [7:0]**

Address Space Identifier. This field is programmed with the value of the current ASID.

***When TTBCR.EAE==1:***

**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

## Accessing the CONTEXTIDR:

To access the CONTEXTIDR:

```
MRC p15,0,<Rt>,c13,c0,1 ; Read CONTEXTIDR into Rt
MCR p15,0,<Rt>,c13,c0,1 ; Write Rt to CONTEXTIDR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1101 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.25 CP15DMB, CP15 Data Memory Barrier operation

The CP15DMB characteristics are:

**Purpose**

Performs a Data Memory Barrier.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| WO | WO | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| WO | WO | WO |

ARM deprecates any use of this operation, and strongly recommends that software use the DMB instruction instead.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL0 and EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL0 and EL1 execution of this instruction is trapped to EL2.

If HSCTLR.CP15BEN==0, PL2 execution of this instruction is UNDEFINED.

If SCTLR.CP15BEN==0, PL0 and PL1 execution of this instruction is UNDEFINED.

If SCTLR_EL1.CP15BEN==0, PL0 execution of this instruction is UNDEFINED.

**Configurations**

There are no configuration notes.

**Attributes**

CP15DMB is a 32-bit system operation.

#### Field descriptions

The CP15DMB operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the CP15DMB operation:

To perform the CP15DMB operation:

```
MCR p15,0,<Rt>,c7,c10,5 ; CP15DMB operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1010 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.26 CP15DSB, CP15 Data Synchronization Barrier operation

The CP15DSB characteristics are:

**Purpose**

Performs a Data Synchronization Barrier.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| WO | WO | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| WO | WO | WO |

ARM deprecates any use of this operation, and strongly recommends that software use the DSB instruction instead.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL0 and EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL0 and EL1 execution of this instruction is trapped to EL2.

If HSCTLR.CP15BEN==0, PL2 execution of this instruction is UNDEFINED.

If SCTLR.CP15BEN==0, PL0 and PL1 execution of this instruction is UNDEFINED.

If SCTLR_EL1.CP15BEN==0, PL0 execution of this instruction is UNDEFINED.

**Configurations**

There are no configuration notes.

**Attributes**

CP15DSB is a 32-bit system operation.

#### Field descriptions

The CP15DSB operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the CP15DSB operation:

To perform the CP15DSB operation:

```
MCR p15,0,<Rt>,c7,c10,4 ; CP15DSB operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1010 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.27 CP15ISB, CP15 Instruction Synchronization Barrier operation

The CP15ISB characteristics are:

**Purpose**

Performs an Instruction Synchronization Barrier.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| WO | WO | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| WO | WO | WO |

ARM deprecates any use of this operation, and strongly recommends that software use the ISB instruction instead.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL0 and EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL0 and EL1 execution of this instruction is trapped to EL2.

If HSCTLR.CP15BEN==0, PL2 execution of this instruction is UNDEFINED.

If SCTLR.CP15BEN==0, PL0 and PL1 execution of this instruction is UNDEFINED.

If SCTLR_EL1.CP15BEN==0, PL0 execution of this instruction is UNDEFINED.

**Configurations**

There are no configuration notes.

**Attributes**

CP15ISB is a 32-bit system operation.

#### Field descriptions

The CP15ISB operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the CP15ISB operation:

To perform the CP15ISB operation:

```
MCR p15,0,<Rt>,c7,c5,4 ; CP15ISB operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0101 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.28 CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

**Purpose**

Controls access to Trace, floating-point, and Advanced SIMD functionality from EL0, EL1, and EL3.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL2.TCPAC==1, Non-secure EL1 accesses to this register are trapped to EL2.

If CPTR_EL3.TCPAC==1, EL1 and EL2 accesses to this register are trapped to EL3.

If HCPTR.TCPAC==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CPACR is architecturally mapped to AArch64 System register CPACR_EL1.

Bits in the NSACR control Non-secure access to the CPACR fields. See the field descriptions for more information.

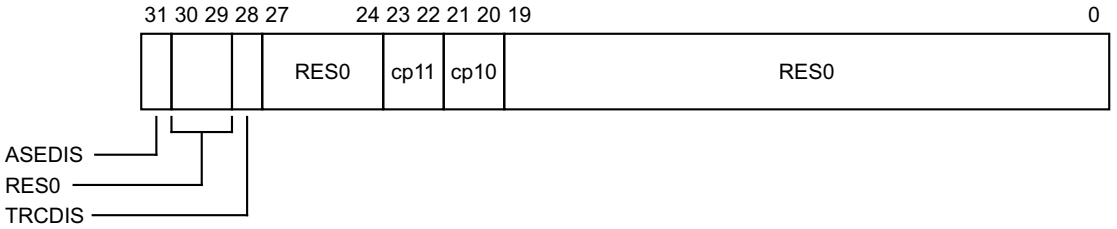
**Note**

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See *Execution privilege, Exception levels, and AArch32 Privilege levels* on page G4-3990.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

CPACR is a 32-bit register.

## Field descriptions

The CPACR bit assignments are:

**ASEDIS, bit [31]**

Disables PL0 and PL1 execution of Advanced SIMD instructions.

`0` This control permits execution of Advanced SIMD instructions at PL0 and PL1.

`1` All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-2332.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bits [30:29]**

Reserved, RES0.

**TRCDIS, bit [28]**

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

`0` This control has no effect on PL0 and PL1 System register accesses to trace registers.

`1` PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode.

If the implementation does not include a trace macrocell, or does not include a System register interface to the trace macrocell registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**Bits [27:24]**

Reserved, RES0.

**cp11, bits [23:22]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**cp10, bits [21:20]**

Defines the access rights for the floating-point and Advanced SIMD functionality. Possible values of the field are:

`00` PL0 and PL1 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.

`01` PL0 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.

`10` Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE. See *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

`11` This control permits full access to the floating-point and Advanced SIMD functionality from PL0 and PL1.

The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

**Note**

The CPACR has no effect on floating-point and Advanced SIMD accesses from PL2. These can be disabled by the HCPTR.TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bits [19:0]**

Reserved, RES0.

### Accessing the CPACR:

To access the CPACR:

```
MRC p15,0,<Rt>,c1,c0,2 ; Read CPACR into Rt
MCR p15,0,<Rt>,c1,c0,2 ; Write Rt to CPACR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.29 CPSR, Current Program Status Register

The CPSR characteristics are:

**Purpose**

Holds PE status and control information.

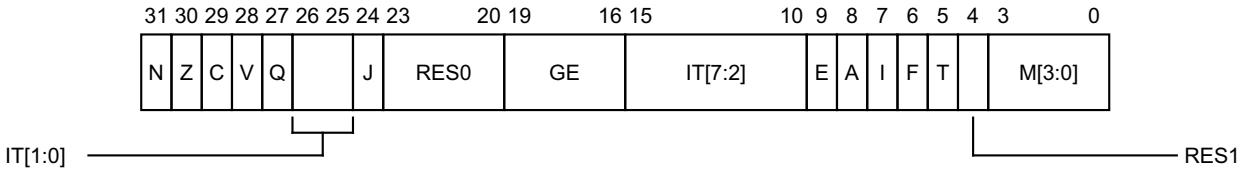
**Usage constraints**

The CPSR can be read using the MRS instruction and written using the MSR (immediate) or MSR (register) instructions. For more details on the instruction syntax, see *PSTATE and banked register access instructions* on page F1-2420.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

CPSR is a 32-bit register.

### Field descriptions

The CPSR bit assignments are:

**N, bit [31]**

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:20]**

Reserved, RES0.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**T, bit [5]**

T32 Instruction set state bit. Indicates the AArch32 instruction set state. Possible values of this bit are:

`0` A32 state.

`1` T32 state.

**Bit [4]**

Reserved, RES1.

**M[3:0], bits [3:0]**

Current PE mode. Possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | User |
| `0b0001` | FIQ |
| `0b0010` | IRQ |
| `0b0011` | Supervisor |
| `0b0110` | Monitor |
| `0b0111` | Abort |
| `0b1010` | Hyp |
| `0b1011` | Undefined |
| `0b1111` | System |

Other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.30 CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

**Purpose**

Selects the current Cache Size ID Register, CCSIDR, by specifying the required cache level and the cache type (either instruction or data cache).

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CSSELR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

CSSELR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CSSELR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

If CSSELR.Level is programmed to a cache level that is not implemented, then a read of CSSELR is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR.{Level, InD}.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID2==1, Non-secure EL1 accesses to this register are trapped to EL2.

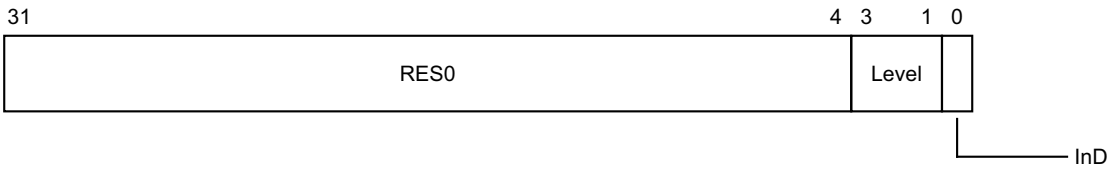
If HSTR.T0==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register CSSELR is architecturally mapped to AArch64 System register CSSELR_EL1.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

CSSELR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The CSSELR bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**Level, bits [3:1]**

Cache level of required cache. Permitted values are:

`000` Level 1 cache

`001` Level 2 cache

`010` Level 3 cache

`011` Level 4 cache

`100` Level 5 cache

`101` Level 6 cache

`110` Level 7 cache

All other values are reserved. See the Usage constraints for the behavior when the Level is programmed to a reserved value, or a cache level that is not implemented.

**InD, bit [0]**

Instruction not Data bit. Permitted values are:

`0` Data or unified cache.

`1` Instruction cache.

### Accessing the CSSELR:

To access the CSSELR:

```
MRC p15,2,<Rt>,c0,c0,0 ; Read CSSELR into Rt
MCR p15,2,<Rt>,c0,c0,0 ; Write Rt to CSSELR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 010 | 0000 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.31 CTR, Cache Type Register

The CTR characteristics are:

**Purpose**

Provides information about the architecture of the caches.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID2==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

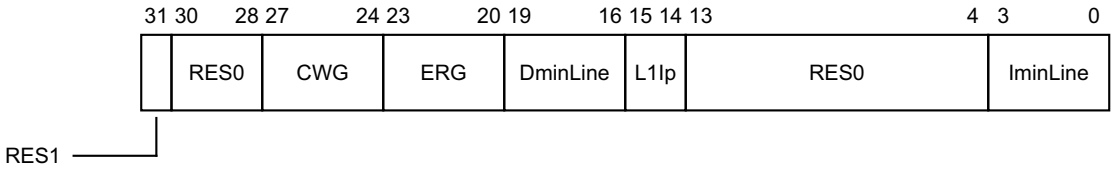
If HCR_EL2.TID2==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register CTR is architecturally mapped to AArch64 System register CTR_EL0.

**Attributes**

CTR is a 32-bit register.

## Field descriptions

The CTR bit assignments are:

**Bit [31]**

Reserved, RES1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [30:28]**

Reserved, RES0.

**CWG, bits [27:24]**

Cache Writeback Granule. $Log_2$ of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of `0b0000` indicates that this register does not provide Cache Writeback Granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache Writeback Granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than `0b1001` are reserved.

**ERG, bits [23:20]**

Exclusives Reservation Granule. $Log_2$ of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

A value of `0b0000` indicates that this register does not provide Exclusives Reservation Granule information and the architectural maximum of 512 words (2KB) must be assumed.

Values greater than `0b1001` are reserved.

**DminLine, bits [19:16]**

$Log_2$ of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

**L1Ip, bits [15:14]**

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

`01` ASID-tagged Virtual Index, Virtual Tag (AIVIVT)

`10` Virtual Index, Physical Tag (VIPT)

`11` Physical Index, Physical Tag (PIPT)

Other values are reserved.

**Bits [13:4]**

Reserved, RES0.

**IminLine, bits [3:0]**

$Log_2$ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

## Accessing the CTR:

To access the CTR:

```
MRC p15,0,<Rt>,c0,c0,1 ; Read CTR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.32 DACR, Domain Access Control Register

The DACR characteristics are:

**Purpose**

Defines the access permission for each of the sixteen memory domains.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

DACR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

DACR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

DACR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T3==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T3==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register DACR is architecturally mapped to AArch64 System register DACR32_EL2.

When EL3 is using AArch32, write access to DACR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

This register has no function when TTBCR.EAE is set to 1, to select the Long-descriptor translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

DACR is a 32-bit register.

## Field descriptions

The DACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| D15 | | | | D14 | | | | D13 | | | | D12 | | | | D11 | | | | D10 | | | | D9 | | | | D8 | | | |
| D7 | | | | D6 | | | | D5 | | | | D4 | | | | D3 | | | | D2 | | | | D1 | | | | D0 | | | |

**D<n>, bits [2n+1:2n], for n = 0 to 15**

Domain n access permission, where n = 0 to 15. Permitted values are:

00 No access. Any access to the domain generates a Domain fault.

01 Client. Accesses are checked against the permission bits in the translation tables.

11 Manager. Accesses are not checked against the permission bits in the translation tables.

The value 10 is reserved.

## Accessing the DACR:

To access the DACR:

```
MRC p15,0,<Rt>,c3,c0,0 ; Read DACR into Rt
MCR p15,0,<Rt>,c3,c0,0 ; Write Rt to DACR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0011 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.33 DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by virtual address to PoC.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

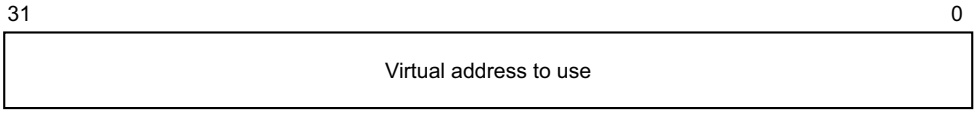
If HCR.TPC==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TPC==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch32 System operation DCCIMVAC performs the same function as AArch64 System operation DC CIVAC.

**Attributes**

DCCIMVAC is a 32-bit system operation.

#### Field descriptions

The DCCIMVAC input value bit assignments are:

**Bits [31:0]**

Virtual address to use.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the DCCIMVAC operation:

To perform the DCCIMVAC operation:

```
MCR p15,0,<Rt>,c7,c14,1 ; DCCIMVAC operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.34 DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by set/way.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TSW==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

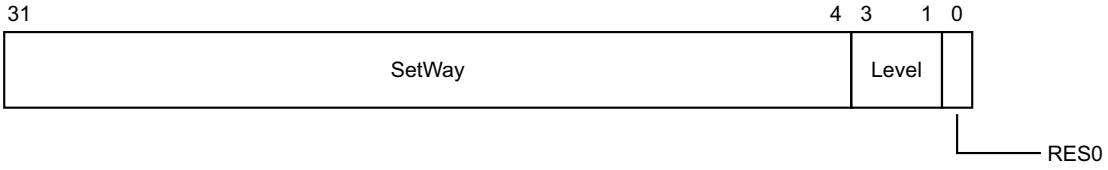
If HCR_EL2.TSW==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation DCCISW performs the same function as AArch64 System operation DC CISW.



**Attributes**

DCCISW is a 32-bit system operation.

#### Field descriptions

The DCCISW input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = $Log_2$(ASSOCIATIVITY), L = $Log_2$(LINELEN), B = (L + S), S = $Log_2$(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

### Performing the DCCISW operation:

To perform the DCCISW operation:

```
MCR p15,0,<Rt>,c7,c14,2 ; DCCISW operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.35 DCCMVAC, Data Cache line Clean by VA to PoC

The DCCMVAC characteristics are:

**Purpose**

Clean data or unified cache line by virtual address to PoC.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

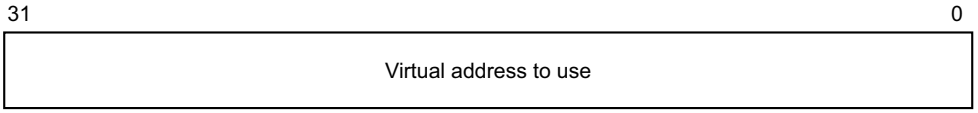
If HCR.TPC==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TPC==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch32 System operation DCCMVAC performs the same function as AArch64 System operation DC CVAC.

**Attributes**

DCCMVAC is a 32-bit system operation.

#### Field descriptions

The DCCMVAC input value bit assignments are:

**Bits [31:0]**

Virtual address to use.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the DCCMVAC operation:

To perform the DCCMVAC operation:

```
MCR p15,0,<Rt>,c7,c10,1 ; DCCMVAC operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.36 DCCMVAU, Data Cache line Clean by VA to PoU

The DCCMVAU characteristics are:

**Purpose**

Clean data or unified cache line by virtual address to PoU.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

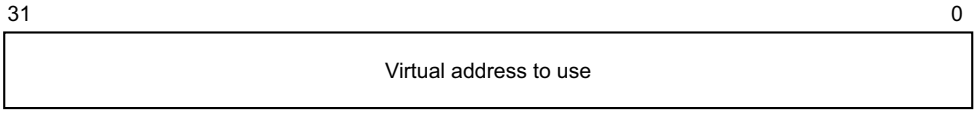
If HCR.TPU==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TPU==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch32 System operation DCCMVAU performs the same function as AArch64 System operation DC CVAU.

**Attributes**

DCCMVAU is a 32-bit system operation.

#### Field descriptions

The DCCMVAU input value bit assignments are:

**Bits [31:0]**

Virtual address to use.

Non-Confidential - Beta

### Performing the DCCMVAU operation:

To perform the DCCMVAU operation:

```
MCR p15,0,<Rt>,c7,c11,1 ; DCCMVAU operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.37 DCCSW, Data Cache line Clean by Set/Way

The DCCSW characteristics are:

**Purpose**

Clean data or unified cache line by set/way.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TSW==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

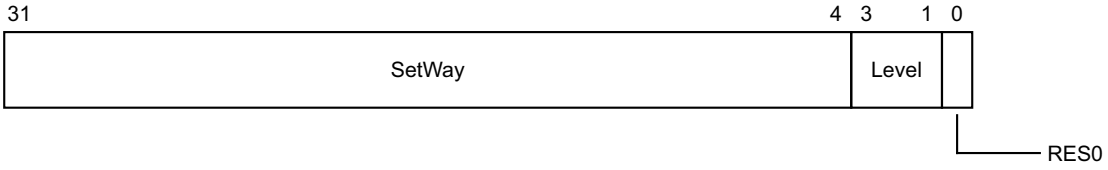
If HCR_EL2.TSW==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation DCCSW performs the same function as AArch64 System operation DC CSW.



**Attributes**

DCCSW is a 32-bit system operation.

#### Field descriptions

The DCCSW input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = $Log_2$(ASSOCIATIVITY), L = $Log_2$(LINELEN), B = (L + S), S = $Log_2$(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

### Performing the DCCSW operation:

To perform the DCCSW operation:

```
MCR p15,0,<Rt>,c7,c10,2 ; DCCSW operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 1010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.38 DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

**Purpose**

Invalidate data or unified cache line by virtual address to PoC.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

It is IMPLEMENTATION DEFINED whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.

At EL1, this instruction must be performed as DCCIMVAC if all of the following apply:

- EL2 is implemented and either:
  - EL2 is using AArch64 and the value of HCR_EL2.VM is 1.
  - EL2 is using AArch32 and the value of HCR.VM is 1.
- Execution is in Non-secure state, or EL3 is not implemented.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TPC==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

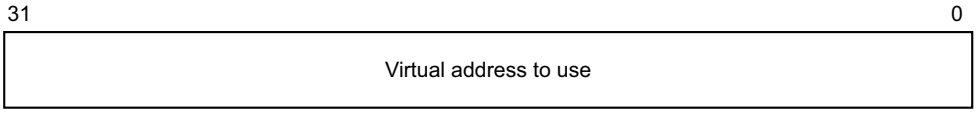
If HCR_EL2.TPC==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation DCIMVAC performs the same function as AArch64 System operation DC IVAC.



**Attributes**

DCIMVAC is a 32-bit system operation.

#### Field descriptions

The DCIMVAC input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Virtual address to use.

### Performing the DCIMVAC operation:

To perform the DCIMVAC operation:

```
MCR p15,0,<Rt>,c7,c6,1 ; DCIMVAC operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.39 DCISW, Data Cache line Invalidate by Set/Way

The DCISW characteristics are:

**Purpose**

Invalidate data or unified cache line by set/way.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

At EL1, this operation must be performed as DCCISW if all of the following apply:

- EL2 is implemented and either:
  - EL2 is using AArch64 and the value of HCR_EL2.{SWIO, VM} is not {0, 0}.
  - EL2 is using AArch32 and the value of HCR.{SWIO, VM} is not {0, 0}.
- Execution is in Non-secure state, or EL3 is not implemented.

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TSW==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

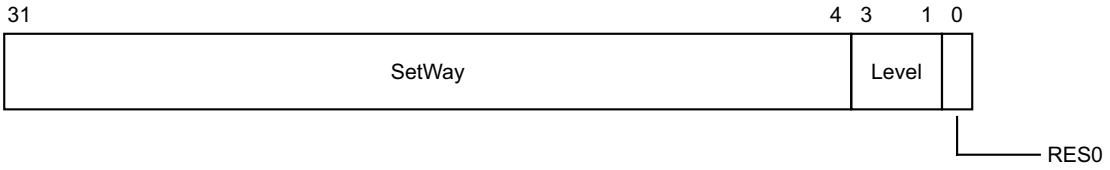
If HCR_EL2.TSW==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation DCISW performs the same function as AArch64 System operation DC ISW.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

DCISW is a 32-bit system operation.

## Field descriptions

The DCISW input value bit assignments are:

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = $Log_2$(ASSOCIATIVITY), L = $Log_2$(LINELEN), B = (L + S), S = $Log_2$(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

## Performing the DCISW operation:

To perform the DCISW operation:

```
MCR p15,0,<Rt>,c7,c6,2 ; DCISW operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.40 DFAR, Data Fault Address Register

The DFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

DFAR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

DFAR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

DFAR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T6==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T6==1, Non-secure EL1 accesses to this register are trapped to EL2.

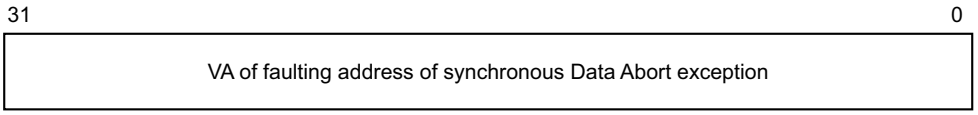
**Configurations**

AArch32 System register DFAR(NS) is architecturally mapped to AArch64 System register FAR_EL1[31:0].

AArch32 System register DFAR(S) is architecturally mapped to AArch32 System register HDFAR when EL2 is implemented.

AArch32 System register DFAR(S) is architecturally mapped to AArch64 System register FAR_EL2[31:0] when EL2 is implemented.

RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

DFAR is a 32-bit register.

## Field descriptions

The DFAR bit assignments are:

**Bits [31:0]**

VA of faulting address of synchronous Data Abort exception.

## Accessing the DFAR:

To access the DFAR:

```
MRC p15,0,<Rt>,c6,c0,0 ; Read DFAR into Rt
MCR p15,0,<Rt>,c6,c0,0 ; Write Rt to DFAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0110 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.41 DFSR, Data Fault Status Register

The DFSR characteristics are:

**Purpose**

Holds status information about the last data fault.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

DFSR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

DFSR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

DFSR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

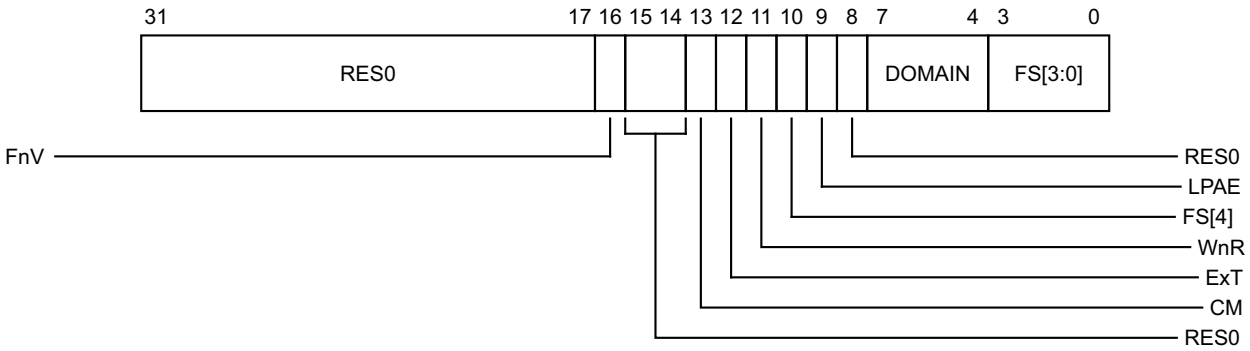
**Configurations**

AArch32 System register DFSR is architecturally mapped to AArch64 System register ESR_EL1.

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**



DFSR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## Field descriptions

The DFSR bit assignments are:

***When TTBCR.EAE==0:***

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 DFAR is valid.

1 DFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

**Bits [15:14]**

Reserved, RES0.

**CM, bit [13]**

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

0 Abort not caused by execution of a cache maintenance instruction.

1 Abort caused by execution of a cache maintenance instruction.

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

For aborts other than external aborts this bit always returns 0.

**WnR, bit [11]**

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

0 Abort caused by a read instruction.

1 Abort caused by a write instruction.

For faults on CP15 cache maintenance instructions, including the VA to PA translation instructions, this bit always returns a value of 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**FS[4], bit [10]**

See FS[3:0], bits [3:0] for description of the FS field.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

0 Using the Short-descriptor translation table formats.

1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**Bit [8]**

Reserved, RES0.

**DOMAIN, bits [7:4]**

Domain of the fault address. Use of this field is deprecated.

**FS[3:0], bits [3:0]**

Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:

00001 Alignment fault

00010 Debug event

00011 Access flag fault, level 1

00100 Fault on instruction cache maintenance

00101 Translation fault, level 1

00110 Access flag fault, level 2

00111 Translation fault, level 2

01000 Synchronous external abort, other than synchronous parity or ECC error, not on translation table walk

01001 Domain fault, level 1

01011 Domain fault, level 2

01100 Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 1

01101 Permission fault, level 1

01110 Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 2

01111 Permission fault, level 2

10000 TLB conflict abort

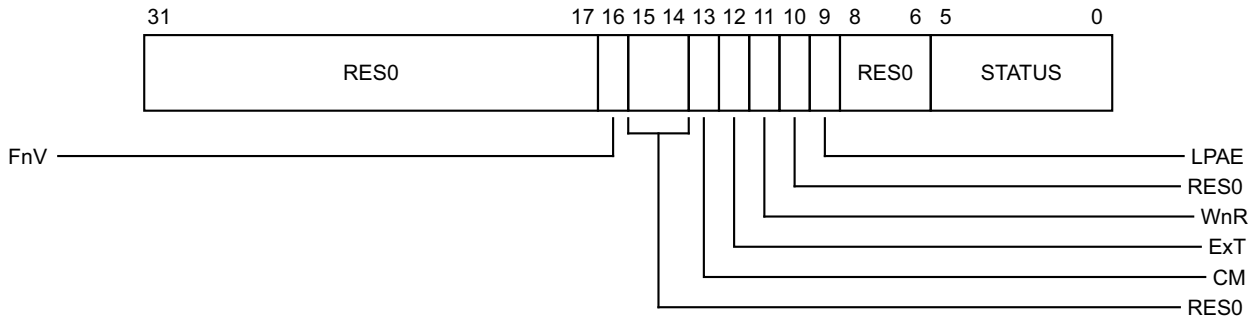
10100 IMPLEMENTATION DEFINED fault (Lockdown fault)

10101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault)

10110 Asynchronous external abort, other than synchronous parity or ECC error

11000 Asynchronous parity or ECC error on memory access

11001 Synchronous parity or ECC error on memory access, not on translation table walk



11100 Synchronous parity or ECC error on translation table walk, level 1

11110 Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

***When TTBCR.EAE==1:***

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 DFAR is valid.

1 DFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

**Bits [15:14]**

Reserved, RES0.

**CM, bit [13]**

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

0 Abort not caused by execution of a cache maintenance instruction.

1 Abort caused by execution of a cache maintenance instruction.

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

For aborts other than external aborts this bit always returns 0.

**WnR, bit [11]**

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

0 Abort caused by a read instruction.

1 Abort caused by a write instruction.

For faults on CP15 cache maintenance instructions, including the VA to PA translation instructions, this bit always returns a value of 1.

Non-Confidential - Beta

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

### Accessing the DFSR:

To access the DFSR:

```
MRC p15,0,<Rt>,c5,c0,0 ; Read DFSR into Rt
MCR p15,0,<Rt>,c5,c0,0 ; Write Rt to DFSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0101 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.42 DTLBIALL, Data TLB Invalidate All

The DTLBIALL characteristics are:

**Purpose**

Invalidate all data TLB entries for the PL1&0 translation regime, subject to the Security state and Privilege level at which the instruction is executed.

For details of the scope of this instruction see TLBIALL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

DTLBIALL is a 32-bit system operation.

#### Field descriptions

The DTLBIALL operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the DTLBIALL operation:

To perform the DTLBIALL operation:

```
MCR p15,0,<Rt>,c8,c6,0 ; DTLBIALL operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0110 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.43 DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

**Purpose**

Invalidate data TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIASID.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

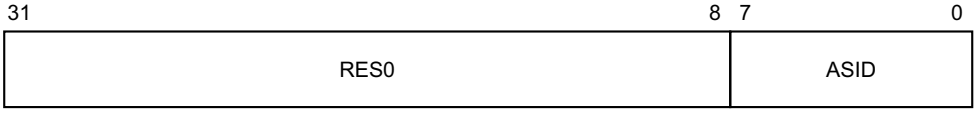
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

DTLBIASID is a 32-bit system operation.

#### Field descriptions

The DTLBIASID input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Performing the DTLBIASID operation:

To perform the DTLBIASID operation:

```
MCR p15,0,<Rt>,c8,c6,2 ; DTLBIASID operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.44 DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

**Purpose**

Invalidate data TLB entries for stage 1 of the PL1&0 translation regime that match the given VA and ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVA.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

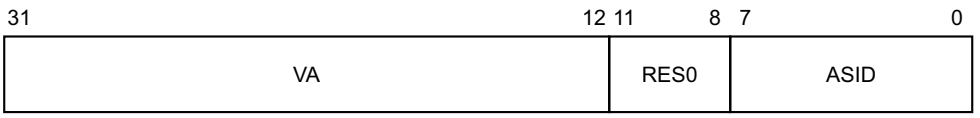
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

DTLBIMVA is a 32-bit system operation.

#### Field descriptions

The DTLBIMVA input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Performing the DTLBIMVA operation:

To perform the DTLBIMVA operation:

```
MCR p15,0,<Rt>,c8,c6,1 ; DTLBIMVA operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.45 ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

**Purpose**

When taking an exception to Hyp mode, holds the address to return to.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

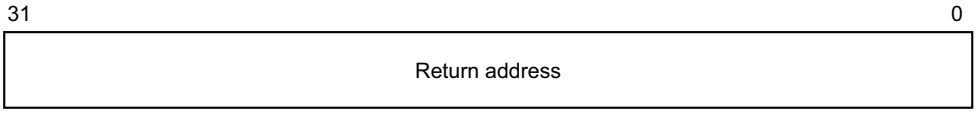
| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register ELR_hyp is architecturally mapped to AArch64 System register ELR_EL2.



On a reset into an Exception level that is using AArch32 ELR_hyp is UNKNOWN.

**Attributes**

ELR_hyp is a 32-bit register.

#### Field descriptions

The ELR_hyp bit assignments are:

**Bits [31:0]**

Return address.

#### Accessing the ELR_hyp:

To access the ELR_hyp:

```
MRS <Rd>, ELR_hyp ; Read ELR_hyp into Rd
MSR ELR_hyp, <Rd> ; Write Rd to ELR_hyp
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| m | m1 | R |
|---|---|---|
| 1 | 1110 | 0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.46 FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

**Purpose**

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

In ARMv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

**Traps and Enables**

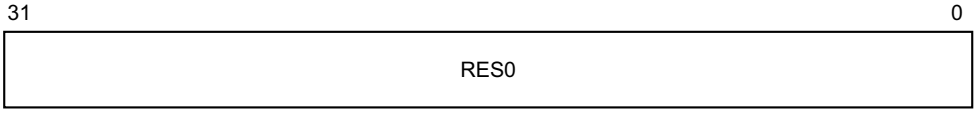
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T13==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

FCSEIDR is a 32-bit register.

#### Field descriptions

The FCSEIDR bit assignments are:

**Bits [31:0]**

Reserved, RES0.

#### Accessing the FCSEIDR:

To access the FCSEIDR:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p15,0,<Rt>,c13,c0,0 ; Read FCSEIDR into Rt
MCR p15,0,<Rt>,c13,c0,0 ; Write Rt to FCSEIDR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1101 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.47 FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

**Purpose**

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RW | Config-RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | Config-RW | Config-RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL2.TFP==1, Non-secure EL1 accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL1 and EL2 accesses to this register are trapped to EL3.

If HCPTR.TCP10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If CPACR.cp10==00, PL1 accesses to this register are UNDEFINED.

If HCPTR.TCP10==1, Non-secure EL2 accesses to this register are UNDEFINED.

If NSACR.cp10==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.

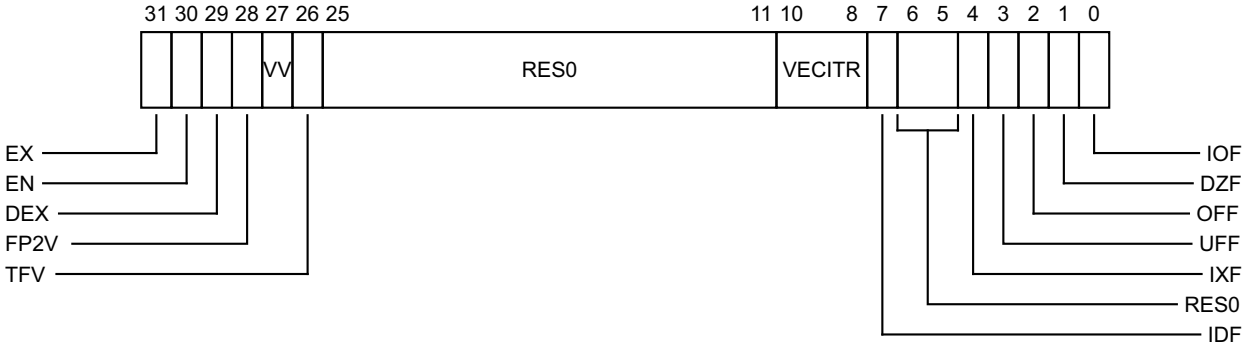
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register FPEXC is architecturally mapped to AArch64 System register FPEXC32_EL2.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

FPEXC is a 32-bit register.

#### Field descriptions

The FPEXC bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EX, bit [31]**

Exception bit. In ARMv8, this bit is RAZ/WI.

**EN, bit [30]**

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

`0` Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.

`1` This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

**Note**

When executing at EL0 using AArch32 with EL1 using AArch64, the PE behaves as if the value of FPEXC.EN bit is 1.

When this register has an architecturally-defined reset value, this field resets to `0`.

**DEX, bit [29]**

Defined synchronous floating-point exception bit.

This bit indicates the cause of an Undefined Instruction exception from the attempted execution of a floating-point instruction, and whether the FPEXC.TFV bit is valid.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The meaning of this bit is:

0 The exception occurred because of the execution of an unallocated instruction in the CP10 or CP11 encoding space. If the FPEXC.TFV bit is a RW bit then it is invalid and UNKNOWN. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW bits then they are invalid and UNKNOWN.

1 The FPEXC.TFV bit is valid and indicates the cause of the exception.

On an exception caused by a trapped floating-point exception, the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**FP2V, bit [28]**

FPINST2 instruction valid bit. In ARMv8, this bit is RES0.

**VV, bit [27]**

VECITR valid bit. In ARMv8, this bit is RES0.

**TFV, bit [26]**

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

0 The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.

1 FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR.{Stride, Len} as RAZ, this bit is RAO/WI.

**Bits [25:11]**

Reserved, RES0.

**VECITR, bits [10:8]**

Vector iteration count. In ARMv8, this field is RES1.

**IDF, bit [7]**

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

0 Input denormal exception has not occurred.

1 Input denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Bits [6:5]**

Reserved, RES0.

**IXF, bit [4]**

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

0 Inexact exception has not occurred.

1 Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**UFF, bit [3]**

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

0 Underflow exception has not occurred.

1 Underflow exception has occurred.

Underflow trapped exceptions can occur only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**OFF, bit [2]**

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

0 Overflow exception has not occurred.

1 Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**DZF, bit [1]**

Divide-by-zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide-by-zero exception occurred while FPSCR.DZE was 1:

0 Divide-by-zero exception has not occurred.

1 Divide-by-zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**IOF, bit [0]**

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

`0` Invalid Operation exception has not occurred.

`1` Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

## Accessing the FPEXC:

To access the FPEXC:

```
VMRS <Rt>, FPEXC ; Read FPEXC into Rt
VMSR FPEXC, <Rt> ; Write Rt to FPEXC
```

Register access is encoded as follows:

| spec_reg |
|---|
| 1000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.48 FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

**Purpose**

Provides floating-point system status information and control.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | Config-RW | Config-RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | Config-RW | Config-RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPACR_EL1.FPEN==00, PL0 accesses to this register are trapped to EL1.

If CPACR_EL1.FPEN==01, PL0 accesses to this register are trapped to EL1.

If CPACR_EL1.FPEN==10, PL0 accesses to this register are trapped to EL1.

If CPTR_EL2.TFP==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If HCPTR.TCP10==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If CPACR.cp10==00, PL0 and PL1 accesses to this register are UNDEFINED.

If CPACR.cp10==01, PL0 accesses to this register are UNDEFINED.

If HCPTR.TCP10==1, Non-secure EL2 accesses to this register are UNDEFINED.

If NSACR.cp10==0, Non-secure EL0, EL1, and EL2 accesses to this register are UNDEFINED.

**Configurations**

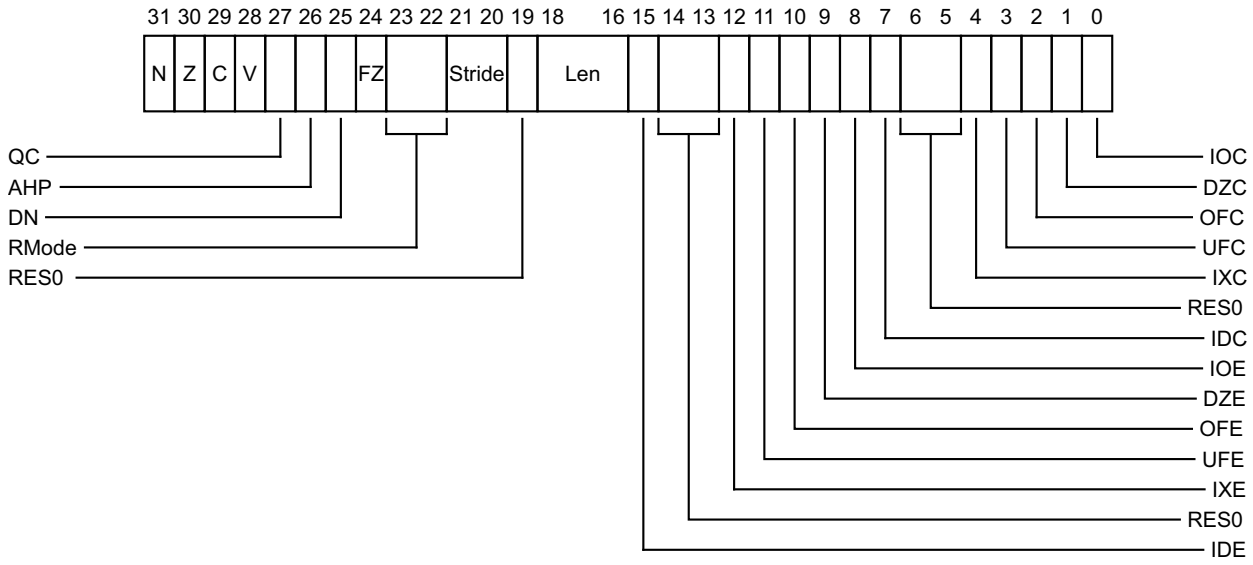
There is one instance of this register that is used in both Secure and Non-secure states.

The named fields in this register map to the equivalent fields in the AArch64 FPCR and FPSR.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

FPSCR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The FPSCR bit assignments are:

**N, bit [31]**

Negative condition flag. This is updated by floating-point comparison operations.

**Z, bit [30]**

Zero condition flag. This is updated by floating-point comparison operations.

**C, bit [29]**

Carry condition flag. This is updated by floating-point comparison operations.

**V, bit [28]**

Overflow condition flag. This is updated by floating-point comparison operations.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

**AHP, bit [26]**

Alternative half-precision control bit:

`0` IEEE half-precision format selected.

`1` Alternative half-precision format selected.

**DN, bit [25]**

Default NaN mode control bit:

`0` NaN operands propagate through to the output of a floating-point operation.

`1` Any operation involving one or more NaNs returns the Default NaN.

The value of this bit only controls scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**FZ, bit [24]**

Flush-to-zero mode control bit:

0 Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.

1 Flush-to-zero mode enabled.

The value of this bit only controls scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

**RMode, bits [23:22]**

Rounding Mode control field. The encoding of this field is:

00 Round to Nearest (RN) mode

01 Round towards Plus Infinity (RP) mode

10 Round towards Minus Infinity (RM) mode

11 Round towards Zero (RZ) mode.

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

**Stride, bits [21:20]**

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

ARM strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

**Bit [19]**

Reserved, RES0.

**Len, bits [18:16]**

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

ARM strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

**IDE, bit [15]**

Input Denormal exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the IDC bit is set to 1.

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit. The trap handling software can decide whether to set the IDC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

**Bits [14:13]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IXE, bit [12]**

Inexact exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the IXC bit is set to 1.

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit. The trap handling software can decide whether to set the IXC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

**UFE, bit [11]**

Underflow exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the UFC bit is set to 1.

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the UFC bit. The trap handling software can decide whether to set the UFC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

**OFE, bit [10]**

Overflow exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the OFC bit is set to 1.

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit. The trap handling software can decide whether to set the OFC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

**DZE, bit [9]**

Division by Zero exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the DZC bit is set to 1.

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit. The trap handling software can decide whether to set the DZC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

**IOE, bit [8]**

Invalid Operation exception trap enable. Possible values are:

0 Untrapped exception handling selected. If the floating-point exception occurs then the IOC bit is set to 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit. The trap handling software can decide whether to set the IOC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

**IDC, bit [7]**

Input Denormal cumulative exception bit. This bit is set to 1 to indicate that the Input Denormal exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

**Bits [6:5]**

Reserved, RES0.

**IXC, bit [4]**

Inexact cumulative exception bit. This bit is set to 1 to indicate that the Inexact exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

**UFC, bit [3]**

Underflow cumulative exception bit. This bit is set to 1 to indicate that the Underflow exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the UFE bit.

**OFC, bit [2]**

Overflow cumulative exception bit. This bit is set to 1 to indicate that the Overflow exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

**DZC, bit [1]**

Division by Zero cumulative exception bit. This bit is set to 1 to indicate that the Division by Zero exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Division by Zero exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

**IOC, bit [0]**

Invalid Operation cumulative exception bit. This bit is set to 1 to indicate that the Invalid Operation exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

### G6.2.49 FPSID, Floating-Point System ID register

The FPSID characteristics are:

**Purpose**

Provides top-level information about the floating-point implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RW | Config-RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | Config-RW | Config-RW |

When access to this register is permitted, write accesses are ignored.

This register largely duplicates information held in the MIDR. ARM deprecates use of it.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL2.TFP==1, Non-secure EL1 accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL1 and EL2 accesses to this register are trapped to EL3.

If HCPTR.TCP10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HCR.TID0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPACR.cp10==00, PL1 accesses to this register are UNDEFINED.

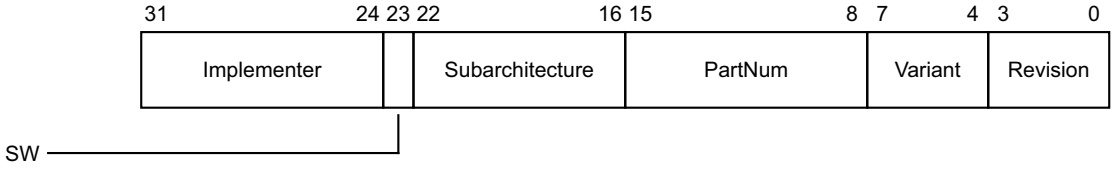
If HCPTR.TCP10==1, Non-secure EL2 accesses to this register are UNDEFINED.

If NSACR.cp10==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.



**Attributes**

FPSID is a 32-bit register.

#### Field descriptions

The FPSID bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Implementer, bits [31:24]**

Implementer codes are the same as those used for the MIDR.

For an implementation by ARM this field is `0x41`, the ASCII code for A.

**SW, bit [23]**

Software bit. Defined values are:

`0` The system includes hardware support for the floating-point instructions provided by the Floating-point extension.

`1` The system provides only software emulation of floating-point instructions provided by the Floating-point extension.

In ARMv8-A the only permitted value is `0`.

**Subarchitecture, bits [22:16]**

Subarchitecture version number. For an implementation by ARM, defined values are:

`0000000` VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.

`0000001` VFPv2 architecture with Common VFP subarchitecture v1.

`0000010` VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.

`0000011` VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR.

`0000100` VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.

For a subarchitecture designed by ARM the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not ARM, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number `0x40`.

**PartNum, bits [15:8]**

An IMPLEMENTATION DEFINED part number for the floating-point implementation, assigned by the implementer.

**Variant, bits [7:4]**

An IMPLEMENTATION DEFINED variant number. Typically, this field distinguishes between different production variants of a single product.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the floating-point implementation.

## G6.2.50 HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

**Purpose**

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

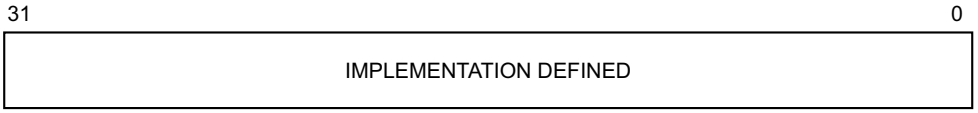
If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HACR is architecturally mapped to AArch64 System register HACR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HACR is a 32-bit register.

### Field descriptions

The HACR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

|---|---|---|---|---|
| 1111 | 100 | 0001 | 0001 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.51 HACTLR, Hyp Auxiliary Control Register

The HACTLR characteristics are:

**Purpose**

Controls IMPLEMENTATION DEFINED features of Hyp mode operation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

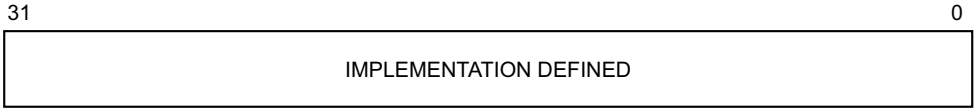
If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HACTLR is architecturally mapped to AArch64 System register ACTLR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HACTLR is a 32-bit register.

#### Field descriptions

The HACTLR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

### G6.2.52 HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

**Purpose**

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

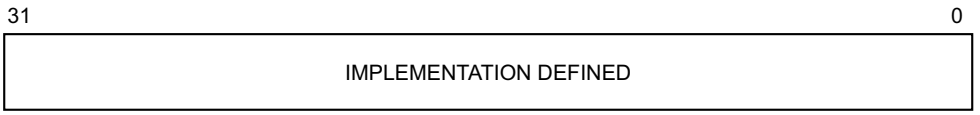
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HACTLR2 is architecturally mapped to AArch64 System register ACTLR_EL2[63:32].

It is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed.

The implementation of this register can be detected by examining bits [7:4] of the ID_MMFR4/ID_MMFR4_EL1 register.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HACTLR2 is a 32-bit register.

#### Field descriptions

The HACTLR2 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the HACTLR2:

To access the HACTLR2:

```
MRC p15,4,<Rt>,c1,c0,3 ; Read HACTLR2 into Rt
MCR p15,4,<Rt>,c1,c0,3 ; Write Rt to HACTLR2
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0000 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.53 HADFSR, Hyp Auxiliary Data Fault Status Register

The HADFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED syndrome information for Data Abort exceptions taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

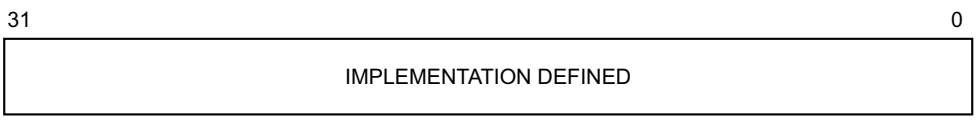
If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HADFSR is architecturally mapped to AArch64 System register AFSR0_EL2.

This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HADFSR is a 32-bit register.

#### Field descriptions

The HADFSR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

### G6.2.54 HAIFSR, Hyp Auxiliary Instruction Fault Status Register

The HAIFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED syndrome information for Prefetch Abort exceptions taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

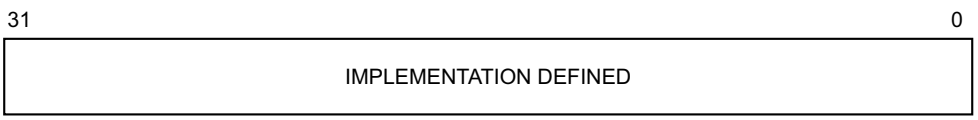
If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HAIFSR is architecturally mapped to AArch64 System register AFSR1_EL2.

This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HAIFSR is a 32-bit register.

#### Field descriptions

The HAIFSR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

### G6.2.55 HAMAIR0, Hyp Auxiliary Memory Attribute Indirection Register 0

The HAMAIR0 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by HMAIR0. These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in HMAIR0.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

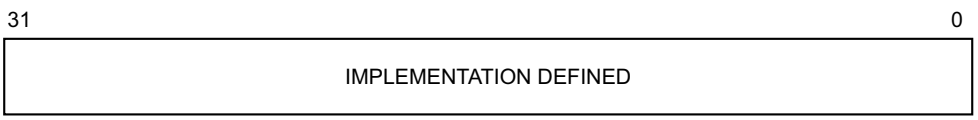
If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HAMAIR0 is architecturally mapped to AArch64 System register AMAIR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HAMAIR0 is a 32-bit register.

#### Field descriptions

The HAMAIR0 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the HAMAIR0:

To access the HAMAIR0:

```
MRC p15,4,<Rt>,c10,c3,0 ; Read HAMAIR0 into Rt
MCR p15,4,<Rt>,c10,c3,0 ; Write Rt to HAMAIR0
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1010 | 0011 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.56 HAMAIR1, Hyp Auxiliary Memory Attribute Indirection Register 1

The HAMAIR1 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by HMAIR1. These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in HMAIR1.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

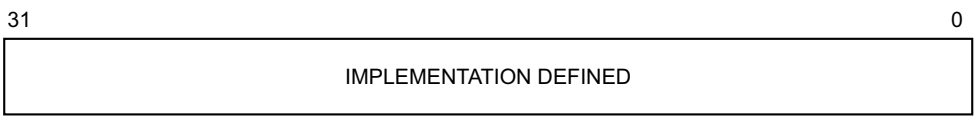
If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HAMAIR1 is architecturally mapped to AArch64 System register AMAIR_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HAMAIR1 is a 32-bit register.

#### Field descriptions

The HAMAIR1 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

## Accessing the HAMAIR1:

To access the HAMAIR1:

```
MRC p15,4,<Rt>,c10,c3,1 ; Read HAMAIR1 into Rt
MCR p15,4,<Rt>,c10,c3,1 ; Write Rt to HAMAIR1
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1010 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.57 HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

**Purpose**

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to Trace, floating-point, and Advanced SIMD functionality.
- Hyp mode access to Trace, floating-point, and Advanced SIMD functionality.

**Note**

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the CPACR and NSACR.
- From Hyp mode are also affected by settings in the NSACR.

Exceptions generated by the CPACR and NSACR controls are higher priority than those generated by the HCPTR controls.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL3.TCPAC==1, EL2 accesses to this register are trapped to EL3.

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

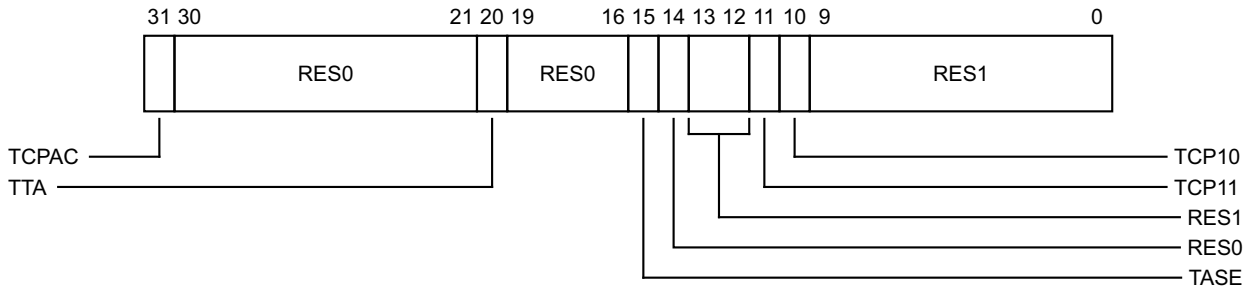
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HCPTR is architecturally mapped to AArch64 System register CPTR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HCPTR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The HCPTR bit assignments are:

**TCPAC, bit [31]**

Traps Non-secure EL1 accesses to the CPACR to Hyp mode.

`0` This control has no effect on Non-secure EL1 accesses to the CPACR.

`1` Non-secure EL1 accesses to the CPACR are trapped to Hyp mode.

**Note**

The CPACR is not accessible at EL0.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bits [30:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

`0` This control has no effect on Non-secure System register accesses to trace registers.

`1` Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates:

- A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
- An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

If the implementation does not include a trace macrocell, or does not include a System register interface to the trace macrocell registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, for all purposes other than reading or writing the value of this field the PE behaves as if the value of this field is 1.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

---

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bits [19:16]**

Reserved, RES0.

**TASE, bit [15]**

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

`0` This control has no effect on Non-secure execution of Advanced SIMD instructions.

`1` When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:

- A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
- An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, then for all purposes other than reading or writing the value of this field the PE behaves as if the value of this field is 1. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-2332.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bit [14]**

Reserved, RES0.

**Bits [13:12]**

Reserved, RES1.

**TCP11, bit [11]**

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 1, for all purposes other than reading or writing the value of this field the PE behaves as if the value of this field is 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TCP10, bit [10]**

Trap Non-secure accesses to floating-point and Advanced SIMD functionality to Hyp mode:

`0` This control has no effect on Non-secure accesses to floating-point and Advanced SIMD functionality.

`1` Any attempted access to floating-point and Advanced SIMD functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:

- A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
- An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 1, for all purposes other than reading or writing the value of this field the PE behaves as if the value of this field is 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bits [9:0]**

Reserved, RES1.

## Accessing the HCPTR:

To access the HCPTR:

```
MRC p15,4,<Rt>,c1,c1,2 ; Read HCPTR into Rt
MCR p15,4,<Rt>,c1,c1,2 ; Write Rt to HCPTR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0001 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.58 HCR, Hyp Configuration Register

The HCR characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

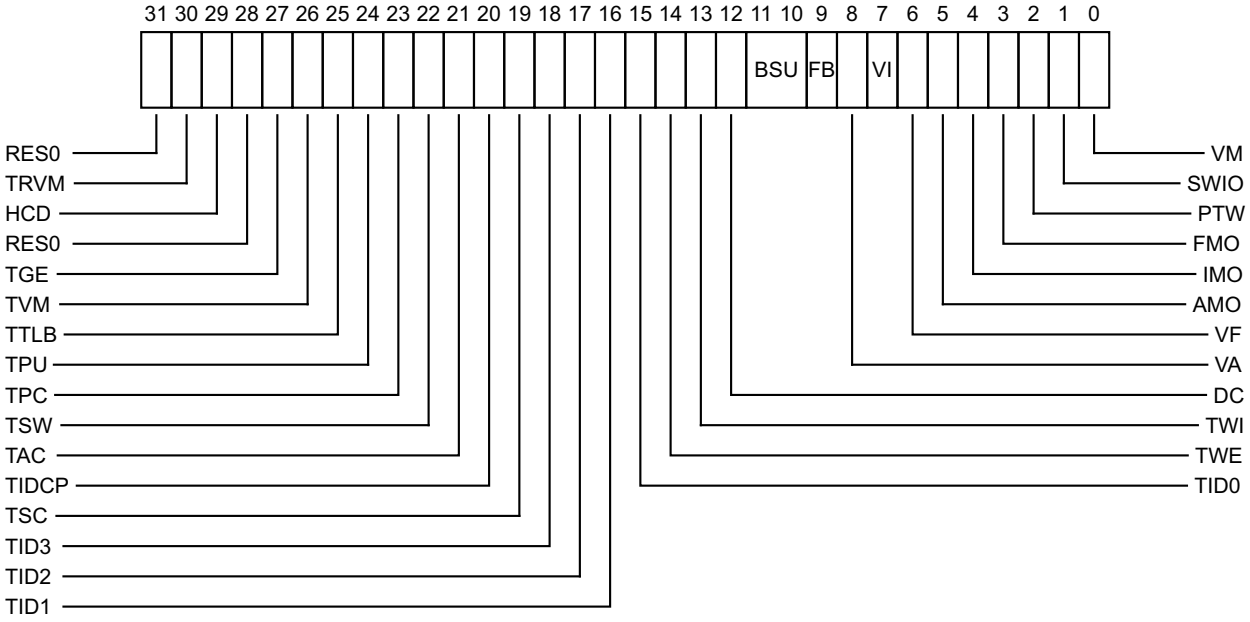
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HCR is architecturally mapped to AArch64 System register HCR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HCR is a 32-bit register.

#### Field descriptions

The HCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [31]**

Reserved, RES0.

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to Hyp mode. The registers for which read accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

`0` This control has no effect on Non-secure EL1 read accesses to Virtual Memory controls.

`1` Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**HCD, bit [29]**

HVC instruction disable. Disables Non-secure state execution of HVC instructions.

`0` HVC instruction execution is enabled at EL2 and Non-secure EL1.

`1` HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

**Note**

HVC instructions are always UNDEFINED at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bit [28]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TGE, bit [27]**

Trap General Exceptions, from Non-secure EL0.

`0` This control has no effect on execution at EL0.

`1` When the value of SCR.NS is 0, this control has no effect on execution at EL0.

When the value of SCR.NS is 1, then:

- All exceptions that would be routed to EL1 are routed to EL2.
- The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR.
- The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR.
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.
- An exception return to EL1 is treated as an illegal exception return.
- Monitor mode execution of an MSR or CPS instruction that changes CPSR.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see *Illegal changes to PSTATE.M* on page G1-3771.

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing SCR.NS from 0 to 1 results in SCR.NS remaining as 0.
- The HDCR.{TDRA, TDOSA, TDA} bits are ignored and treated as being 1 other than for the purpose of a direct read of HDCR.

In the following cases the field resets to 0:

- The PE resets into EL3 with EL3 using AArch32.
- The PE resets into EL2 with EL2 using AArch32.

Otherwise, the field reset value is architecturally UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TVM, bit [26]**

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to Hyp mode. The registers for which write accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

`0` This control has no effect on Non-secure EL1 write accesses to EL1 virtual memory control registers.

`1` Non-secure EL1 write accesses to EL1 virtual memory control registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TTLB, bit [25]**

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to Hyp mode. This applies to the following instructions:

TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIMVA, ITLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL

`0` This control has no effect on Non-secure EL1 accesses to TLB maintenance instructions.

`1` Non-secure EL1 accesses to TLB maintenance instructions are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TPU, bit [24]**

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to Hyp mode. This applies to the following instructions:

ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at PL0.

`0` This control has no effect on the execution of cache maintenance instructions.

`1` Non-secure EL1 execution of the specified instructions is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TPC, bit [23]**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to Hyp mode. This applies to the following instructions:

DCIMVAC, DCCIMVAC, DCCMVAC.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at PL0.

`0` This control has no effect on the execution of cache maintenance instructions.

`1` Non-secure execution of the specified instructions is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TSW, bit [22]**

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to Hyp mode. This applies to the following instructions:

DCISW, DCCSW, DCCISW.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

`0` This control has no effect on the execution of cache maintenance instructions.

`1` Non-secure execution of the specified instructions is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TAC, bit [21]**

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to Hyp mode, from both Execution states. This applies to the following register accesses:

ACTLR and, if implemented, ACTLR2.

`0` This control has no effect on Non-secure EL1 accesses to the Auxiliary Control Registers.

`1` Non-secure EL1 accesses to the specified registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TIDCP, bit [20]**

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to Hyp mode.

MCR and MRC instructions as follows:

- All CP15, CRn==9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All CP15, CRn==10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All CP15, CRn==11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to Hyp mode. If it is not, it is UNDEFINED, and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

`0` This control has no effect on Non-secure EL1 and EL0 accesses to the System register encodings for IMPLEMENTATION DEFINED functionality.

`1` Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TSC, bit [19]**

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

`0` This control has no effect on execution of SMC instructions.

`1` Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD.

The ARMv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

**Note**

- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TID3, bit [18]**

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to Hyp mode:

ID_PFR0, ID_PFR1, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5, MVFR0, MVFR1, MVFR2, and ID_MMFR4, except that if ID_MMFR4 is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 are trapped.

Also an MRC access to any of the following CP15 encodings:

- opc1 == 0, CRn == c0, CRm == {c3-c7}, opc2 == {0,1}.
- opc1 == 0, CRn == c0, CRm == c3, opc2 == 2.
- opc1 == 0, CRn == c0, CRm == c5, opc2 == {4,5}.

It is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to CP15 encodings in the following range that are not already mentioned in this field description:

- opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

`0` This control has no effect on Non-secure EL1 reads of the ID group 3 registers.

`1` The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, this field resets to 0.

**TID2, bit [17]**

Trap ID group 2. Traps the following register accesses to Hyp mode:

- Non-secure EL1 and EL0 reads of the CTR, CCSIDR, CLIDR, and CSSELR.
- Non-secure EL1 and EL0 writes to the CSSELR.

0 This control has no effect on Non-secure EL1 and EL0 accesses to the ID group 2 registers.

1 The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**TID1, bit [16]**

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to Hyp mode:

TCMTR, TLBTR, REVIDR, AIDR.

0 This control has no effect on Non-secure EL1 reads of the ID group 1 registers.

1 The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**TID0, bit [15]**

Trap ID group 0. Traps the following register accesses to Hyp mode:

- Non-secure EL1 reads of the JIDR.
- If the JIDR is RAZ from Non-secure EL0, Non-secure EL0 of the JIDR.
- Non-secure EL1 reads of the FPSID.

**Note**

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The FPSID is not accessible at PL0.
- When the FPSID is accessible, a VMSR FPSID, <Rt> instruction is permitted but is ignored. The execution of this instruction is not trapped by this trap.

0 This control has no effect on Non-secure EL1 reads of the ID group 0 registers.

1 The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**TWE, bit [14]**

Traps Non-secure EL0 and EL1 execution of WFE instructions to Hyp mode:

0 This control has no effect on the execution of WFE instructions at Non-secure EL1 and Non-secure EL0.

1 Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to Hyp mode, if the instruction would otherwise have caused the PE to enter a low-power state, except that when the value of SCTLR.nTWE is 0, the trap of PL0 execution to Undefined mode takes precedence over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TWI, bit [13]**

Traps Non-secure EL0 and EL1 execution of WFI instructions to Hyp mode.

`0` This control has no effect on the execution of WFI instructions at Non-secure EL1 and Non-secure EL0.

`1` Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to Hyp mode, if the instruction would otherwise have caused the PE to enter a low-power state, except that when the value of SCTLR.nTWI is 0, the trap of PL0 execution to Undefined mode takes precedence over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to `0`.

**DC, bit [12]**

Default cacheable.

`0` This control has no effect on the Non-secure EL1&0 translation regime.

`1` In Non-secure state:

- The SCTLR.M bit to behave as 0 for all purposes other than a direct read of the value of the bit.
- The HCR.VM bit to behave as 1 for all purposes other than a direct read of the value of the bit.
- When stage 1 translations of PL1&0 translation regime are disabled, the memory type produced by the first stage of the PL1&0 translation regime is Normal Non-Shareable, Inner WriteBack Read-WriteAllocate, Outer WriteBack Read-WriteAllocate.

When this bit is 0 and stage 1 translations of EL1&0 translation regime are disabled, the default memory attribute for Data accesses is Device-nGnRnE.

This bit has no effect on the EL2 and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to `0`.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

`00` No effect

`01` Inner Shareable

`10` Outer Shareable

`11` Full system

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When this register has an architecturally-defined reset value, this field resets to `0`.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.

`0` This field has no effect on the operation of the specified instructions.

`1` When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When this register has an architecturally-defined reset value, this field resets to `0`.

**VA, bit [8]**

Virtual Asynchronous Abort exception.

`0` This mechanism is not making a virtual Asynchronous Abort pending.

`1` A virtual Asynchronous Abort is pending because of this mechanism.

The virtual Asynchronous Abort is only enabled when the value of HCR.AMO bit is 1.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

When this register has an architecturally-defined reset value, this field resets to `0`.

**VI, bit [7]**

Virtual IRQ exception.

`0` This mechanism is not making a virtual IRQ pending.

`1` A virtual IRQ is pending because of this mechanism.

The virtual IRQ is only enabled when the value of HCR.IMO bit is 1.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

When this register has an architecturally-defined reset value, this field resets to `0`.

**VF, bit [6]**

Virtual FIQ exception.

`0` This mechanism is not making a virtual FIQ pending.

`1` A virtual FIQ is pending because of this mechanism.

The virtual FIQ is only enabled when the value of HCR.FMO bit is 1.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

When this register has an architecturally-defined reset value, this field resets to `0`.

**AMO, bit [5]**

Asynchronous Abort Mask Override. When this bit is set to 1, it overrides the effect of CPSR.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

When this register has an architecturally-defined reset value, this field resets to `0`.

**IMO, bit [4]**

IRQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, this field resets to 0.

**FMO, bit [3]**

FIQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

When this register has an architecturally-defined reset value, this field resets to 0.

**PTW, bit [2]**

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

0 The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.

1 The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

**SWIO, bit [1]**

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to be treated as data cache clean and invalidate by set/way.

0 This control has no effect on the operation of data cache invalidate by set/way instructions.

1 Data cache invalidate by set/way instructions operate as data cache clean and invalidate by set/way.

When this bit is set to 1, DCISW is executed as DCCISW.

As a result of changes to the behavior of DCISW, this bit is redundant in ARMv8. This bit can be implemented as RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to 0.

**VM, bit [0]**

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime. Possible values of this bit are:

0 Non-secure EL1&0 stage 2 address translation disabled.

1 Non-secure EL1&0 stage 2 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 operate as data cache clean and invalidate instructions. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the HCR:

To access the HCR:

```
MRC p15,4,<Rt>,c1,c1,0 ; Read HCR into Rt
MCR p15,4,<Rt>,c1,c1,0 ; Write Rt to HCR
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.59 HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

**Purpose**

Provides additional configuration controls for virtualization.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

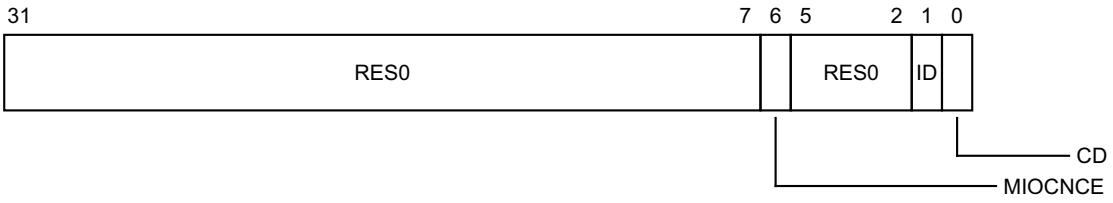
If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HCR2 is architecturally mapped to AArch64 System register HCR_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HCR2 is a 32-bit register.

#### Field descriptions

The HCR2 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:7]**

Reserved, RES0.

**MIOCNCE, bit [6]**

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

`0` For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

`1` For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see *Mismatched memory attributes* on page E2-2392.

The value of this field has no effect on translation regimes other than the Non-secure PL1&0 translation regime.

This field can be implemented as RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**Bits [5:2]**

Reserved, RES0.

**ID, bit [1]**

Stage 2 Instruction cache disable. For the Non-secure PL1&0 translation regime, when HCR.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

`0` This control has no effect on stage 2 of the Non-secure PL1&0 translation regime.

`1` For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

When this register has an architecturally-defined reset value, this field resets to `0`.

**CD, bit [0]**

Stage 2 Data cache disable. When HCR.VM==1, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

`0` This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.

`1` For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

When this register has an architecturally-defined reset value, this field resets to `0`.

## Accessing the HCR2:

To access the HCR2:

```
MRC p15,4,<Rt>,c1,c1,4 ; Read HCR2 into Rt
MCR p15,4,<Rt>,c1,c1,4 ; Write Rt to HCR2
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0001 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.60 HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Any execution in a Non-secure EL1 mode, or in Secure state, makes the HDFAR UNKNOWN.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T6==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

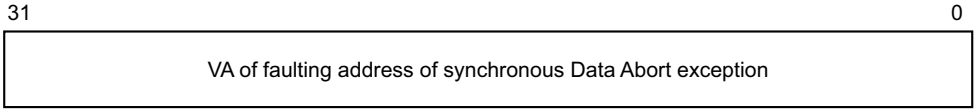
If HSTR_EL2.T6==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HDFAR is architecturally mapped to AArch64 System register FAR_EL2[31:0].

AArch32 System register HDFAR is architecturally mapped to AArch32 System register DFAR (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HDFAR is a 32-bit register.

### Field descriptions

The HDFAR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

VA of faulting address of synchronous Data Abort exception.

## Accessing the HDFAR:

To access the HDFAR:

```
MRC p15,4,<Rt>,c6,c0,0 ; Read HDFAR into Rt
MCR p15,4,<Rt>,c6,c0,0 ; Write Rt to HDFAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0110 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.61 HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Any execution in a Non-secure EL1 mode, or in Secure state, makes the HIFAR UNKNOWN.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T6==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

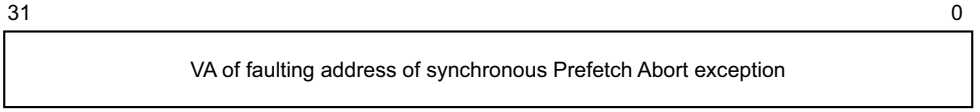
If HSTR_EL2.T6==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HIFAR is architecturally mapped to AArch64 System register FAR_EL2[63:32].

AArch32 System register HIFAR is architecturally mapped to AArch32 System register IFAR (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HIFAR is a 32-bit register.

#### Field descriptions

The HIFAR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

VA of faulting address of synchronous Prefetch Abort exception.

### Accessing the HIFAR:

To access the HIFAR:

```
MRC p15,4,<Rt>,c6,c0,2 ; Read HIFAR into Rt
MCR p15,4,<Rt>,c6,c0,2 ; Write Rt to HIFAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0110 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.62 HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

**Purpose**

Along with HMAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

AttrIndx[2], from the translation table descriptor, selects the appropriate HMAIR: setting AttrIndx[2] to 0 selects HMAIR0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

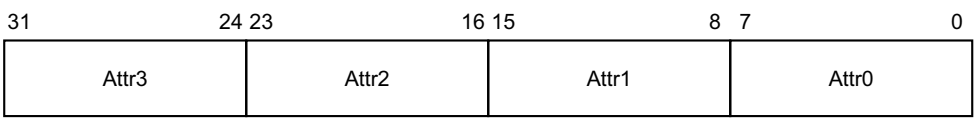
If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HMAIR0 is architecturally mapped to AArch64 System register MAIR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HMAIR0 is a 32-bit register.

### Field descriptions

The HMAIR0 bit assignments are:

***When TTBCR.EAE==1:***

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attr<n>, bits [8n+7:8n], for n = 0 to 3**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|---|---|
| 0000 | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| 00RW, RW not 00 | Normal Memory, Outer Write-through transient |
| 0100 | Normal Memory, Outer Non-cacheable |
| 01RW, RW not 00 | Normal Memory, Outer Write-back transient |
| 10RW | Normal Memory, Outer Write-through non-transient |
| 11RW | Normal Memory, Outer Write-back non-transient |

R = Outer Read Allocate Policy, W = Outer Write Allocate Policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0000 | Meaning when Attr<n>[7:4] is not 0000 |
|---|---|---|
| 0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 00RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through transient |
| 0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 01RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back transient |
| 1000 | Device-nGRE memory | Normal Memory, Inner Write-through non-transient (RW=00) |
| 10RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through non-transient |
| 1100 | Device-GRE memory | Normal Memory, Inner Write-back non-transient (RW=00) |
| 11RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back non-transient |

R = Inner Read Allocate Policy, W = Inner Write Allocate Policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|---|---|
| 0 | Do not allocate |
| 1 | Allocate |

## Accessing the HMAIR0:

To access the HMAIR0:

```
MRC p15,4,<Rt>,c10,c2,0 ; Read HMAIR0 into Rt
MCR p15,4,<Rt>,c10,c2,0 ; Write Rt to HMAIR0
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1010 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.63 HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

**Purpose**

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

AttrIndx[2], from the translation table descriptor, selects the appropriate HMAIR: setting AttrIndx[2] to 1 selects HMAIR1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

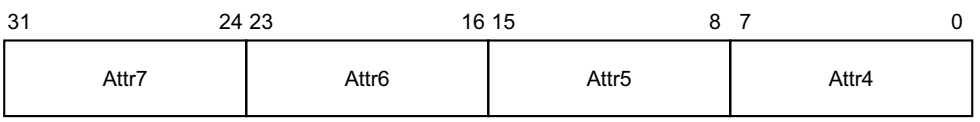
If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HMAIR1 is architecturally mapped to AArch64 System register MAIR_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HMAIR1 is a 32-bit register.

## Field descriptions

The HMAIR1 bit assignments are:

***When TTBCR.EAE==1:***

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|---|---|
| 0000 | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| 00RW, RW not 00 | Normal Memory, Outer Write-through transient |
| 0100 | Normal Memory, Outer Non-cacheable |
| 01RW, RW not 00 | Normal Memory, Outer Write-back transient |
| 10RW | Normal Memory, Outer Write-through non-transient |
| 11RW | Normal Memory, Outer Write-back non-transient |

R = Outer Read Allocate Policy, W = Outer Write Allocate Policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0000 | Meaning when Attr<n>[7:4] is not 0000 |
|---|---|---|
| 0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 00RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through transient |
| 0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 01RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back transient |
| 1000 | Device-nGRE memory | Normal Memory, Inner Write-through non-transient (RW=00) |
| 10RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through non-transient |
| 1100 | Device-GRE memory | Normal Memory, Inner Write-back non-transient (RW=00) |
| 11RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back non-transient |

R = Inner Read Allocate Policy, W = Inner Write Allocate Policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|---|---|
| 0 | Do not allocate |
| 1 | Allocate |

### Accessing the HMAIR1:

To access the HMAIR1:

```
MRC p15,4,<Rt>,c10,c2,1 ; Read HMAIR1 into Rt
MCR p15,4,<Rt>,c10,c2,1 ; Write Rt to HMAIR1
```

## G6.2.64 HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

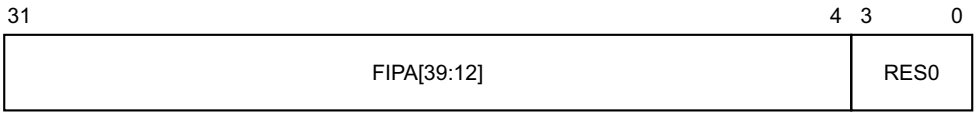
If HSTR.T6==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T6==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HPFAR is architecturally mapped to AArch64 System register HPFAR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HPFAR is a 32-bit register.

### Field descriptions

The HPFAR bit assignments are:

**FIPA[39:12], bits [31:4]**

Bits [39:12] of the faulting intermediate physical address.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [3:0]**

Reserved, RES0.

## Accessing the HPFAR:

To access the HPFAR:

```
MRC p15,4,<Rt>,c6,c0,4 ; Read HPFAR into Rt
MCR p15,4,<Rt>,c6,c0,4 ; Write Rt to HPFAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0110 | 0000 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.65 HRMR, Hyp Reset Management Register

The HRMR characteristics are:

**Purpose**

If EL2 is the highest implemented Exception level:

- A write to the register can request a Warm reset.
- If EL2 can use AArch32 and AArch64, specifies the Execution state that the PE boots into on a Warm reset.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

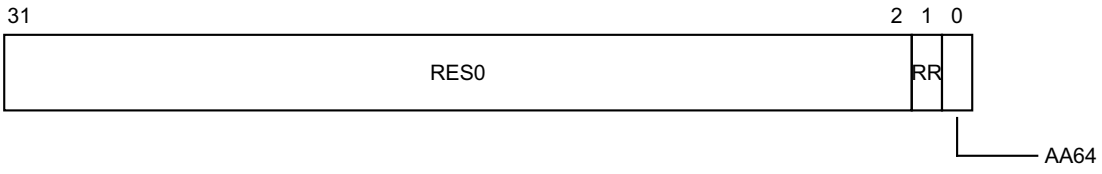
AArch32 System register HRMR is architecturally mapped to AArch64 System register RMR_EL2.

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

When this register is not implemented its encoding is UNDEFINED.

See the field descriptions for the reset values. These apply whenever the register is implemented.



**Attributes**

HRMR is a 32-bit register.

### Field descriptions

The HRMR bit assignments are:

***When EL2 implemented, EL3 not implemented:***

**Bits [31:2]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to `0`. This reset value applies on a Cold reset and on a Warm reset.

**AA64, bit [0]**

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

`0` AArch32.

`1` AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

If this field is implemented as an RW field, this field resets to `0`. This reset value applies on a Cold reset.

### Accessing the HRMR:

To access the HRMR when EL2 implemented, EL3 not implemented:

```
MRC p15,4,<Rt>,c12,c0,2 ; Read HRMR into Rt
MCR p15,4,<Rt>,c12,c0,2 ; Write Rt to HRMR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1100 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.66 HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

**Purpose**

Provides top level control of the system operation in Hyp mode. This register provides Hyp mode control of features controlled by the Banked SCTLR bits, and shows the values of the non-Banked SCTLR bits.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

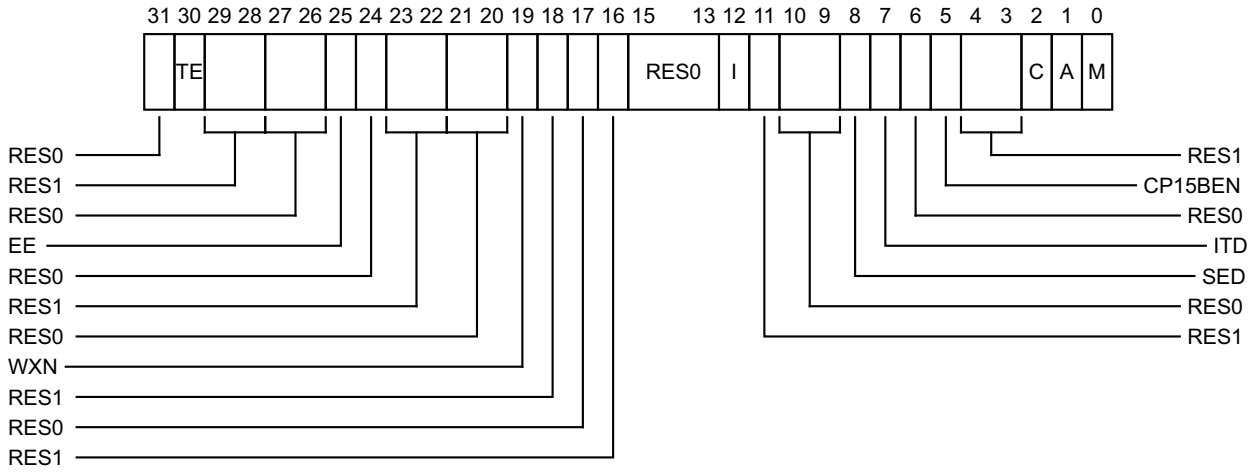
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HSCTLR is architecturally mapped to AArch64 System register SCTLR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HSCTLR is a 32-bit register.

### Field descriptions

The HSCTLR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [31]**

Reserved, RES0.

**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

0 Exceptions, including reset, taken to A32 state.

1 Exceptions, including reset, taken to T32 state.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Bits [29:28]**

Reserved, RES1.

**Bits [27:26]**

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the PL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

0 Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the PL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian.

1 Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the PL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [23:22]**

Reserved, RES1.

**Bits [21:20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writeable to be treated as XN. The possible values of this bit are:

`0` This control has no effect on memory access permissions.

`1` Any region that is writeable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:13]**

Reserved, RES0.

**I, bit [12]**

Instruction cache enable. This is an enable bit for instruction caches at EL2:

`0` All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.

If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

`1` All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache.

If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&0 translation regime.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bit [11]**

Reserved, RES1.

**Bits [10:9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at PL2.

`0` SETEND instruction execution is enabled at PL2.

`1` SETEND instructions are UNDEFINED at PL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at PL2.

0 All IT instruction functionality is enabled at PL2.

1 Any attempt at PL2 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0]!=1000.
- All encodings of the subsequent instruction with the following values for hw1:

  11xxxxxxxxxxxxx
  All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.

  1011xxxxxxxxxxx
  All instructions in *Miscellaneous 16-bit instructions* on page F3-2471.

  10100xxxxxxxxxx
  ADD Rd, PC, #imm

  01001xxxxxxxxxx
  LDR Rd, [PC, #imm]

  0100x1xxx1111xxx
  ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.

  010001xx1xxxx111
  ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

  These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

  It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

  - A 16-bit instruction, that can only be followed by another 16-bit instruction.
  - The first half of a 32-bit instruction.

  This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

  An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

**Bit [6]**

Reserved, RES0.

**CP15BEN, bit [5]**

CP15 memory barrier instruction enable. Enables accesses to the CP15 DMB, DSB, and ISB barrier operations from PL2.

0 PL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.

1 PL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAO/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to a value that is architecturally UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [4:3]**

Reserved, RES1.

**C, bit [2]**

Cache enable, for data caching.

0 All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.

1 All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

When this register has an architecturally-defined reset value, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

0 Alignment fault checking disabled when executing at EL2.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

1 Alignment fault checking enabled when executing at EL2.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**M, bit [0]**

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

0 EL2 stage 1 address translation disabled.

See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.

1 EL2 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the HSCTLR:

To access the HSCTLR:

```
MRC p15,4,<Rt>,c1,c0,0 ; Read HSCTLR into Rt
MCR p15,4,<Rt>,c1,c0,0 ; Write Rt to HSCTLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.67 HSR, Hyp Syndrome Register

The HSR characteristics are:

**Purpose**

Holds syndrome information for an exception taken to Hyp mode.

See also *Use of the HSR* on page G4-4105.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

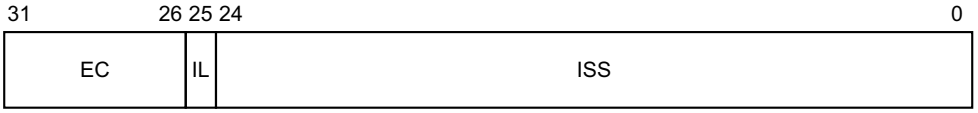
If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HSR is architecturally mapped to AArch64 System register ESR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HSR is a 32-bit register.

## Field descriptions

The HSR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

**EC == 000000, Exceptions with an unknown reason**

Unknown reason.

See *ISS encoding for exceptions with an unknown reason* on page G6-4379.

**EC == 000001, Exception from a WFI or WFE instruction**

Trapped WFI or WFE instruction.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

See *ISS encoding for an exception from a WFI or WFE instruction* on page G6-4379.

**EC == 000011, Exception from an MCR or MRC access**

Trapped MCR or MRC access to CP15.

See *ISS encoding for an exception from an MCR or MRC access* on page G6-4380.

**EC == 000100, Exception from an MCRR or MRRC access**

Trapped MCRR or MRRC access to CP15.

See *ISS encoding for an exception from an MCRR or MRRC access* on page G6-4382.

**EC == 000101, Exception from an MCR or MRC access**

Trapped MCR or MRC access to CP14.

See *ISS encoding for an exception from an MCR or MRC access* on page G6-4380.

**EC == 000110, Exception from an LDC or STC access to CP14**

Trapped LDC or STC access to CP14.

See *ISS encoding for an exception from an LDC or STC access to CP14* on page G6-4383.

**EC == 000111, Exception from an access to SIMD or floating-point functionality, resulting from HCPTR**

Exception from an access to SIMD or floating-point functionality, as a result of HCPTR.

Excludes exceptions resulting from when Advanced SIMD and floating-point are not implemented. These are reported with EC value `0b000000`.

See *ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR* on page G6-4385.

**EC == 001000, Exception from an MCR or MRC access**

Trapped MRC or VMRS access to CP10, for ID group traps.

See *ISS encoding for an exception from an MCR or MRC access* on page G6-4380.

**EC == 001100, Exception from an MCRR or MRRC access**

Trapped MRRC or MCRR access to CP14.

See *ISS encoding for an exception from an MCRR or MRRC access* on page G6-4382.

**EC == 001110, Exception from an Illegal state or PC alignment fault**

Illegal state exception taken to AArch32 state.

See *ISS encoding for an exception from an Illegal state or PC alignment fault* on page G6-4390.

**EC == 010001, Exception from HVC or SVC instruction execution**

SVC taken to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

See *ISS encoding for an exception from HVC or SVC instruction execution* on page G6-4386.

**EC == 010010, Exception from HVC or SVC instruction execution**

HVC executed.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page G6-4386.

**EC == 010011, Exception from SMC instruction execution**

Trapped SMC instruction.

See *ISS encoding for an exception from SMC instruction execution* on page G6-4387.

**EC == 100000, Exception from a Prefetch abort**

Prefetch Abort routed to Hyp mode.

See *ISS encoding for an exception from a Prefetch abort* on page G6-4388.

**EC == 100001, Exception from a Prefetch abort**

Prefetch Abort taken from Hyp mode.

See *ISS encoding for an exception from a Prefetch abort* on page G6-4388.

**EC == 100010, Exception from an Illegal state or PC alignment fault**

PC alignment fault exception.

See *ISS encoding for an exception from an Illegal state or PC alignment fault* on page G6-4390.

**EC == 100100, Exception from a Data abort**

Data Abort routed to Hyp mode.

See *ISS encoding for an exception from a Data abort* on page G6-4391.

**EC == 100101, Exception from a Data abort**

Data Abort taken from Hyp mode.

See *ISS encoding for an exception from a Data abort* on page G6-4391.

All other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

**IL, bit [25]**

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

`0` 16-bit instruction trapped.

`1` 32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC field is `0b000000`, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts that do not have valid ISS information, or for which the ISS is not valid.
- When the EC value is `0b001110`, indicating an Illegal state exception.

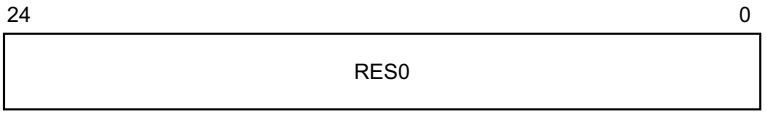
**Note**

This is a change from the behavior in ARMv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.



The following subsections describe each ISS format.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

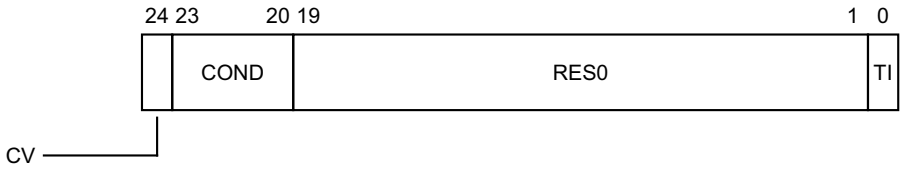
### ISS encoding for exceptions with an unknown reason

This encoding is used by Unknown reason.

The ISS encoding for these exceptions is:

**Bits [24:0]**

Reserved, RES0.



*Undefined Instruction exception, when the value of HCR.TGE is 1* on page G1-3791 describes the configuration settings for a trap that returns an HSR.EC value of `0b000000`.

### ISS encoding for an exception from a WFI or WFE instruction

This encoding is used by Trapped WFI or WFE instruction.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

The ISS encoding for these exceptions is:

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

`0` The COND field is not valid.

`1` The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

**Bits [19:1]**

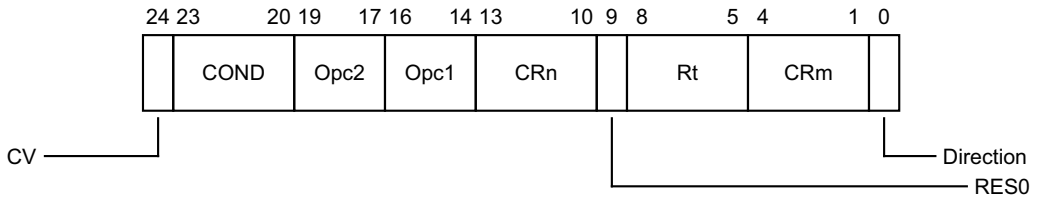
Reserved, RES0.

**TI, bit [0]**

Trapped instruction. Possible values of this bit are:

`0` WFI trapped.

`1` WFE trapped.



*Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-3865 describes the configuration settings for this trap.

### ISS encoding for an exception from an MCR or MRC access

This encoding is used by:

- Trapped MCR or MRC access to CP15.
- Trapped MCR or MRC access to CP14.
- Trapped MRC or VMRS access to CP10, for ID group traps.

The ISS encoding for these exceptions is:

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

`0` The COND field is not valid.

`1` The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

`0` Write to coprocessor. MCR instruction.

`1` Read from coprocessor. MRC or VMRS instruction.

The following sections describe configuration settings for traps that are reported using EC value `0b000011`:

- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers* on page G1-3862.
- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations* on page G1-3860.
- *Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions* on page G1-3860.
- *Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions* on page G1-3859.
- *Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register* on page G1-3860.
- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers* on page G1-3872.
- *Traps to Hyp mode of Non-secure EL1 accesses to the CPACR* on page G1-3867.
- *Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers* on page G1-3858.

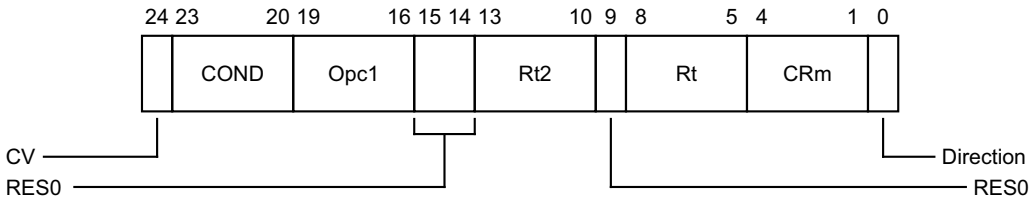
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- *General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to CP15 System registers* on page G1-3868.

The following sections describe configuration settings for traps that are reported using EC value `0b000101`:

- *ID group 0, Primary device identification registers* on page G1-3863.
- *Traps to Hyp mode of Non-secure System register accesses to trace registers* on page G1-3867.
- *Trapping Non-secure System register accesses to Debug ROM registers* on page G1-3870.
- *Trapping Non-secure System register accesses to powerdown debug registers* on page G1-3870.
- *Trapping general Non-secure System register accesses to debug registers* on page G1-3871.

The following sections describes configuration settings for traps that are reported using EC value `0b001000`:



- *ID group 0, Primary device identification registers* on page G1-3863.
- *ID group 3, Detailed feature identification registers* on page G1-3864.

### *ISS encoding for an exception from an MCRR or MRRC access*

This encoding is used by:

- Trapped MCRR or MRRC access to CP15.
- Trapped MRRC or MCRR access to CP14.

The ISS encoding for these exceptions is:

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

`0` The COND field is not valid.

`1` The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

**Bits [15:14]**

Reserved, RES0.

**Rt2, bits [13:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

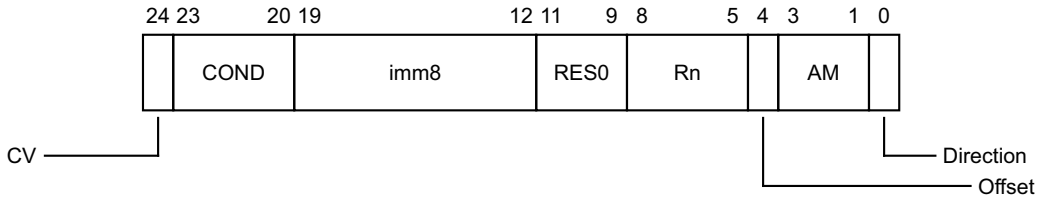
`0` Write to coprocessor. MCRR instruction.

`1` Read from coprocessor. MRRC instruction.

The following sections describe configuration settings for traps that are reported using EC value `0b000100`:

- *Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers* on page G1-3858.
- *General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to CP15 System registers* on page G1-3868.

The following sections describe configuration settings for traps that are reported using EC value `0b001100`:



- *Traps to Hyp mode of Non-secure System register accesses to trace registers* on page G1-3867.
- *Trapping Non-secure System register accesses to Debug ROM registers* on page G1-3870.

### *ISS encoding for an exception from an LDC or STC access to CP14*

This encoding is used by Trapped LDC or STC access to CP14.

The ISS encoding for these exceptions is:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

`0` The COND field is not valid.

`1` The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

**Bits [11:9]**

Reserved, RES0.

**Rn, bits [8:5]**

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

`0` Subtract offset.

`1` Add offset.

This bit corresponds to the U bit in the instruction encoding.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

`000` Immediate unindexed.

`001` Immediate post-indexed.

`010` Immediate offset.

`011` Immediate pre-indexed.

`100` Literal unindexed.
A32 instruction set only.
For a trapped LDC T32 instruction or STC T32 instruction, this encoding is reserved.

`110` Literal offset.
For the STC instruction, valid only in the A32 instruction set.
For a trapped STC T32 instruction, this encoding is reserved.

The values `0b101` and `0b111` are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

**Direction, bit [0]**

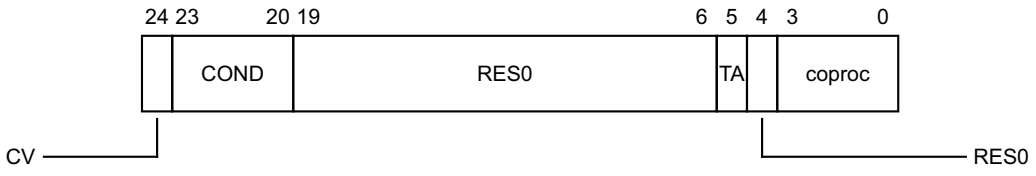
Indicates the direction of the trapped instruction. The possible values of this bit are:

`0` Write to memory. STC instruction.

`1` Read from memory. LDC instruction.

The only architected uses of these instructions to access CP14 are:

- An STC to write to DBGDTRRXint.
- An LDC to read DBGDTRTXint.



*Trapping general Non-secure System register accesses to debug registers* on page G1-3871 describes the configuration settings for the trap that is reported using EC value `0b000110`.

### *ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR*

This encoding is used by Exception from an access to SIMD or floating-point functionality, as a result of HCPTR.

Excludes exceptions resulting from when Advanced SIMD and floating-point are not implemented. These are reported with EC value `0b000000`.

The ISS encoding for these exceptions is:

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

`0` The COND field is not valid.

`1` The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

**Bits [19:6]**

Reserved, RES0.

**TA, bit [5]**

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

`0` Exception was not caused by trapped use of Advanced SIMD functionality.

`1` Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-2332.

**Bit [4]**

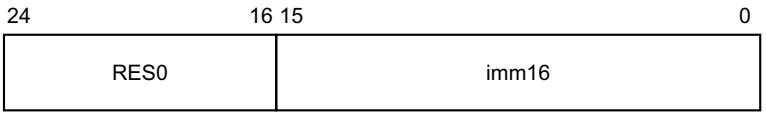
Reserved, RES0.

**coproc, bits [3:0]**

The number of the coprocessor accessed by the trapped operation. This is always `0b1010`.

The following sections describe the configuration settings for the traps that are reported using EC value `0b000111`:

- *General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers* on page G1-3865.
- *Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality* on page G1-3866.



### *ISS encoding for an exception from HVC or SVC instruction execution*

This encoding is used by:

- SVC taken to Hyp mode.
- HVC executed.

The ISS encoding for these exceptions is:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [24:16]**

Reserved, RES0.

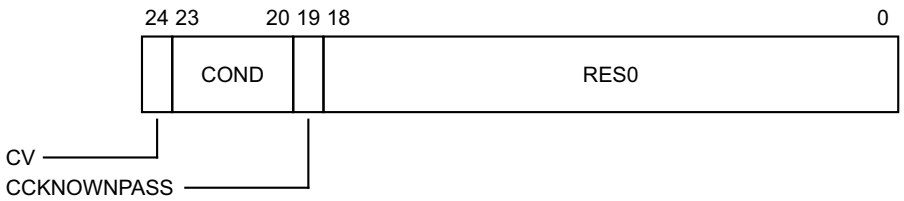
**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.



The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

*Supervisor Call exception, when the value of HCR.TGE is 1* on page G1-3791 describes the configuration settings for the trap reported with EC value `0b010001`.

### *ISS encoding for an exception from SMC instruction execution*

This encoding is used by Trapped SMC instruction.

The ISS encoding for these exceptions is:

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

`0` The COND field is not valid.

`1` The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

**COND, bits [23:20]**

The condition code for the trapped instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

**CCKNOWNPASS, bit [19]**

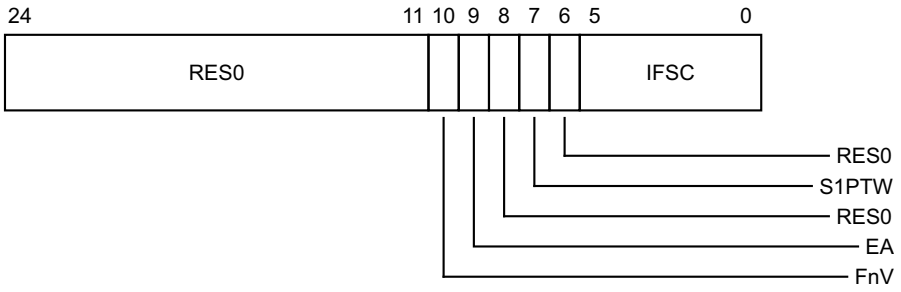
Indicates whether the instruction might have failed its condition code check.

`0` The instruction was unconditional, or was conditional and passed its condition code check.

`1` The instruction was conditional, and might have failed its condition code check.

**Bits [18:0]**

Reserved, RES0.



*Traps to Hyp mode of Non-secure EL1 execution of SMC instructions* on page G1-3861 describes the configuration settings for this trap, for instructions executed in Non-secure PL1 modes.

### *ISS encoding for an exception from a Prefetch abort*

This encoding is used by:

- Prefetch Abort routed to Hyp mode.
- Prefetch Abort taken from Hyp mode.

The ISS encoding for these exceptions is:

**Bits [24:11]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**FnV, bit [10]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

`0` HIFAR is valid.

`1` HIFAR is not valid, and holds an UNKNOWN value.

This field is only valid when the IFSC field is `0b010000`, that is it is valid only for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of external aborts.

For any abort other than an External abort this bit returns a value of 0.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a fault on the stage 2 translation of an address accessed during a stage 1 translation table walk:

`0` Fault not on a stage 2 translation for a stage 1 translation table walk.

`1` Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For a fault other than a stage 2 fault, this bit is RES0.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:

`000000` Address size fault, translation table base register

`000001` Address size fault, level 1

`000010` Address size fault, level 2

`000011` Address size fault, level 3

`000101` Translation fault, level 1

`000110` Translation fault, level 2

`000111` Translation fault, level 3

`001001` Access flag fault, level 1

`001010` Access flag fault, level 2

`001011` Access flag fault, level 3

`001101` Permission fault, level 1

`001110` Permission fault, level 2

`001111` Permission fault, level 3

`010000` Synchronous external abort, other than synchronous parity or ECC error, not on translation table walk

`011000` Synchronous parity or ECC error on memory access, not on translation table walk

`010101` Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 1

`010110` Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 2

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`010111` Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 3

`011101` Synchronous parity or ECC error on memory access on translation table walk, level 1

`011110` Synchronous parity or ECC error on memory access on translation table walk, level 2

`011111` Synchronous parity or ECC error on memory access on translation table walk, level 3

`100001` Alignment fault

`100010` Debug event, only when the EC value is `0b100001`

`110000` TLB conflict abort

All other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 1 fault.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value `0b100000`:

- *Abort exceptions, when the value of HCR.TGE is 1* on page G1-3792.
- *Routing debug exceptions to EL2* on page G1-3795.

### ISS encoding for an exception from an Illegal state or PC alignment fault

This encoding is used by:

- Illegal state exception taken to AArch32 state.
- PC alignment fault exception.

The ISS encoding for these exceptions is:

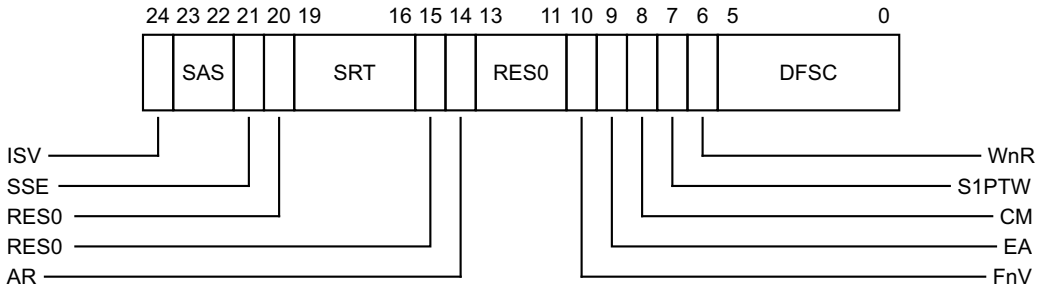
**Bits [24:0]**

Reserved, RES0.

For more information about the Illegal state exception, see:

- *Illegal changes to PSTATE.M* on page G1-3771.
- *Illegal return events from AArch32 state* on page G1-3797.
- *Legal returns that set PSTATE.IL to 1* on page G1-3799.
- *The Illegal Execution state exception* on page G1-3799.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



For more information about the PC alignment fault exception, see *Branching to an unaligned PC* on page K1-5424.

### *ISS encoding for an exception from a Data abort*

This encoding is used by:

- Data Abort routed to Hyp mode.
- Data Abort taken from Hyp mode.

The ISS encoding for these exceptions is:

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

`0` No valid instruction syndrome. ISS[23:14] are RES0.

`1` ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except those generated by a stage 2 translation. For Data Abort exceptions generated by a stage 2 translation, this bit is 1 and a valid instruction syndrome is returned, only if all of the following are true:

- The instruction that generated the Data Abort exception:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using the PC as a source or destination register.

A stage 2 abort on a stage 1 translation table lookup sets ISV to 0.

It is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a Synchronous external abort on stage 2 translation table walks.

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

`00` Byte

`01` Halfword

`10` Word

`11` Doubleword

This field is RES0 when the value of ISV is 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

`0` Sign-extension not required.

`1` Data item must be sign-extended.

For all other operations this bit is 0.

This field is RES0 when the value of ISV is 0.

**Bit [20]**

Reserved, RES0.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction, as viewed in AArch64 state.

This field is RES0 when the value of ISV is 0.

**Bit [15]**

Reserved, RES0.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

`0` Instruction did not have acquire/release semantics.

`1` Instruction did have acquire/release semantics.

This field is RES0 when the value of ISV is 0.

**Bits [13:11]**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

`0` HDFAR is valid.

`1` HDFAR is not valid, and holds an UNKNOWN value.

This field is only valid when the DFSC field is `0b010000`, that is it is valid only for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of external aborts.

For any abort other than an External abort this bit returns a value of 0.

**CM, bit [8]**

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

`0` Fault not generated by a cache maintenance or address translation instruction.

`1` Fault generated by a cache maintenance or address translation instruction.

For asynchronous faults, this bit is 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a fault on the stage 2 translation of an address accessed during a stage 1 translation table walk:

0 Fault not on a stage 2 translation for a stage 1 translation table walk.

1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For a fault other than a stage 2 fault, this bit is RES0.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

0 Abort caused by a read instruction.

1 Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For an asynchronous Data Abort exception this bit is UNKNOWN.

**DFSC, bits [5:0]**

Data Fault Status Code. Possible values of this field are:

000000 Address size fault, translation table base register

000001 Address size fault, level 1

000010 Address size fault, level 2

000011 Address size fault, level 3

000101 Translation fault, level 1

000110 Translation fault, level 2

000111 Translation fault, level 3

001001 Access flag fault, level 1

001010 Access flag fault, level 2

001011 Access flag fault, level 3

001101 Permission fault, level 1

001110 Permission fault, level 2

001111 Permission fault, level 3

010000 Synchronous external abort, other than synchronous parity or ECC error, not on translation table walk

011000 Synchronous parity or ECC error on memory access, not on translation table walk

010001 Asynchronous external abort, other than asynchronous parity or ECC error

011001 Asynchronous parity or ECC error on memory access

010101 Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 1

010110 Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 2

010111 Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 3

011101 Synchronous parity or ECC error on memory access on translation table walk, level 1

011110 Synchronous parity or ECC error on memory access on translation table walk, level 2

011111 Synchronous parity or ECC error on memory access on translation table walk, level 3

100001 Alignment fault

100010 Debug event, only when the EC value is 0b100100

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`110000` TLB conflict abort

`110100` IMPLEMENTATION DEFINED fault (Lockdown fault)

`110101` IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault)

All other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 1 fault.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value `0b100100`:

- *Abort exceptions, when the value of HCR.TGE is 1* on page G1-3792.
- *Routing debug exceptions to EL2* on page G1-3795.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of `0b100000` or `0b100100`:

- *Hyp mode control of Non-secure access permissions* on page G4-4044.
- *Memory fault reporting in Hyp mode* on page G4-4103.

### Accessing the HSR:

To access the HSR:

```
MRC p15,4,<Rt>,c5,c2,0 ; Read HSR into Rt
MCR p15,4,<Rt>,c5,c2,0 ; Write Rt to HSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0101 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.68 HSTR, Hyp System Trap Register

The HSTR characteristics are:

**Purpose**

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to the CP15 primary coprocessor registers, {c0-c3,c5-c13,c15} using MCR, MRC, MCRR, and MRRC instructions.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

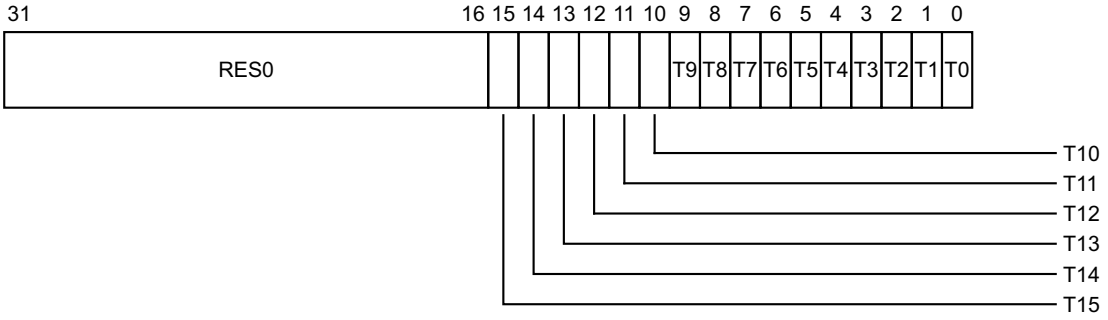
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HSTR is architecturally mapped to AArch64 System register HSTR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

HSTR is a 32-bit register.

### Field descriptions

The HSTR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:16]**

Reserved, RES0.

**T<n>, bit [n], for n = 0 to 15**

HSTR.{T0-T3, T5-T13, T15} trap Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the CP15 System registers, by the accessed primary CP15 register number, {c0-c3, c5-c13, c15}.

`0` This control has no effect on Non-secure EL0 or EL1 accesses to the CP15 System registers.

`1` Any Non-secure EL1 MCR, MRC, MCRR, or MRRC access to a corresponding register is trapped to Hyp mode.

A Non-secure EL0 MCR, MRC, MCRR, or MRRC access to the corresponding CP15 System register is trapped to Hyp mode only if it is not UNDEFINED when this bit is zero.

The primary CP15 register number is the value of <CRn> for an MCR or MRC instruction, or the value of <CRm> for an MCRR or MRRC instruction.

For example, when HSTR.T7 is 1:

- Any 32-bit CP15 access from a Non-secure EL1 mode, using an MCR or MRC instruction with <CRn> set to c7, is trapped to Hyp mode.
- Any 64-bit CP15 access from a Non-secure EL1 mode, using an MCRR or MRRC instruction with <CRm> set to c7, is trapped to Hyp mode.

Fields T4 and T14 are RES0.

When this register has an architecturally-defined reset value, this field resets to `0`.

## Accessing the HSTR:

To access the HSTR:

```
MRC p15,4,<Rt>,c1,c1,3 ; Read HSTR into Rt
MCR p15,4,<Rt>,c1,c1,3 ; Write Rt to HSTR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0001 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.69 HTCR, Hyp Translation Control Register

The HTCR characteristics are:

**Purpose**

Controls translation table walks required for the stage 1 translation of memory accesses from Hyp mode, and holds cacheability and shareability information for the accesses.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Used in conjunction with HTTBR, that defines the translation table base address for the translations.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

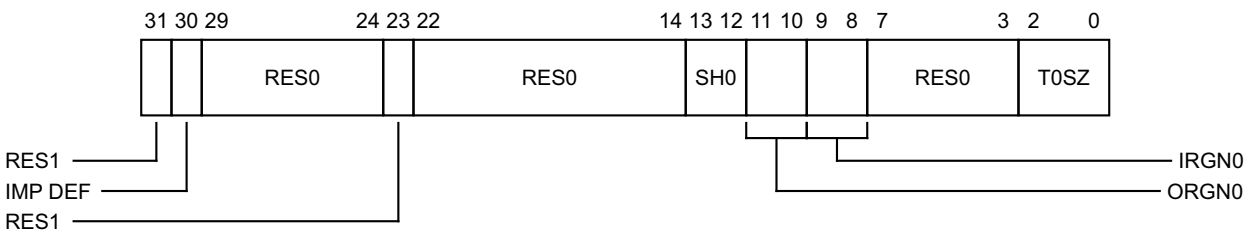
If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HTCR is architecturally mapped to AArch64 System register TCR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HTCR is a 32-bit register.

#### Field descriptions

The HTCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [31]**

### G6.2.70 HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

**Purpose**

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

The PE never updates this register. This means the register is always UNKNOWN on reset.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

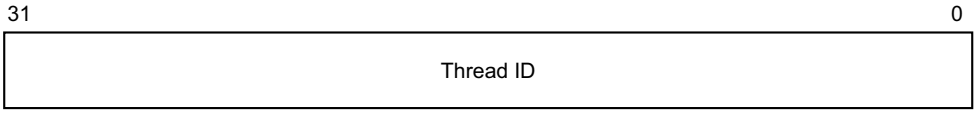
Subject to the prioritization rules:

If HSTR.T13==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HTPIDR is architecturally mapped to AArch64 System register TPIDR_EL2[31:0].



If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HTPIDR is a 32-bit register.

## Field descriptions

The HTPIDR bit assignments are:

**Bits [31:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the HTPIDR:

To access the HTPIDR:

```
MRC p15,4,<Rt>,c13,c0,2 ; Read HTPIDR into Rt
MCR p15,4,<Rt>,c13,c0,2 ; Write Rt to HTPIDR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1101 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.71 HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the stage 1 translation of memory accesses from Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Used in conjunction with the HTCR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

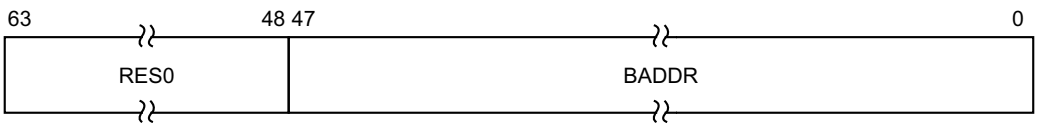
If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HTTBR is architecturally mapped to AArch64 System register TTBR0_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HTTBR is a 64-bit register.

#### Field descriptions

The HTTBR bit assignments are:

**Bits [63:48]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**BADDR, bits [47:0]**

Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 - HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 - HTCR.T0SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

## Accessing the HTTBR:

To access the HTTBR:

```
MRRC p15,4,<Rt>,<Rt2>,c2 ; Read HTTBR[31:0] into Rt and HTTBR[63:32] into Rt2
MCRR p15,4,<Rt>,<Rt2>,c2 ; Write Rt to HTTBR[31:0] and Rt2 to HTTBR[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0100 | 0010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.72 HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HVBAR is architecturally mapped to AArch64 System register VBAR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HVBAR is a 32-bit register.

### Field descriptions

The HVBAR bit assignments are:

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

**Bits [4:0]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the HVBAR:

To access the HVBAR:

```
MRC p15,4,<Rt>,c12,c0,0 ; Read HVBAR into Rt
MCR p15,4,<Rt>,c12,c0,0 ; Write Rt to HVBAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1100 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.73 ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

**Purpose**

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TPU==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TPU==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation ICIALLU performs the same function as AArch64 System operation IC IALLU.

**Attributes**

ICIALLU is a 32-bit system operation.

#### Field descriptions

The ICIALLU operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the ICIALLU operation:

To perform the ICIALLU operation:

```
MCR p15,0,<Rt>,c7,c5,0 ; ICIALLU operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.74 ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

**Purpose**

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TPU==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TPU==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation ICIALLUIS performs the same function as AArch64 System operation IC IALLUIS.

**Attributes**

ICIALLUIS is a 32-bit system operation.

#### Field descriptions

The ICIALLUIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the ICIALLUIS operation:

To perform the ICIALLUIS operation:

```
MCR p15,0,<Rt>,c7,c1,0 ; ICIALLUIS operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.75 ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

**Purpose**

Invalidate instruction cache line by virtual address to PoU.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

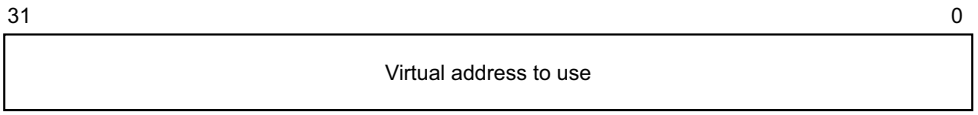
If HCR.TPU==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TPU==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



AArch32 System operation ICIMVAU performs the same function as AArch64 System operation IC IVAU.

**Attributes**

ICIMVAU is a 32-bit system operation.

## Field descriptions

The ICIMVAU input value bit assignments are:

**Bits [31:0]**

Virtual address to use.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Performing the ICIMVAU operation:

To perform the ICIMVAU operation:

```
MCR p15,0,<Rt>,c7,c5,1 ; ICIMVAU operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.76 ID_AFR0, Auxiliary Feature Register 0

The ID_AFR0 characteristics are:

**Purpose**

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with the Main ID Register, MIDR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

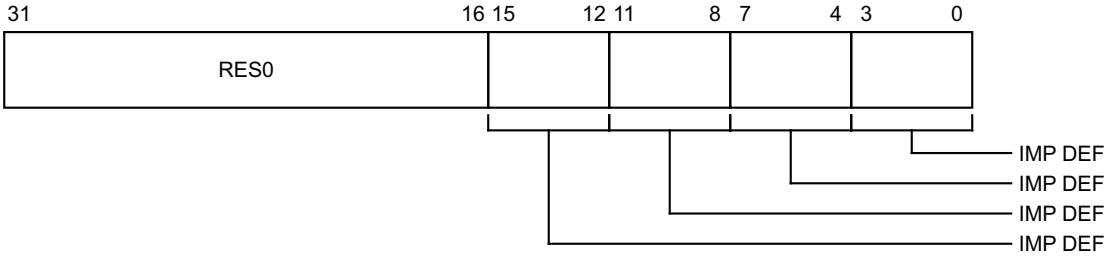
If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_AFR0 is architecturally mapped to AArch64 System register ID_AFR0_EL1.



**Attributes**

ID_AFR0 is a 32-bit register.

#### Field descriptions

The ID_AFR0 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:16]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [15:12]**

### G6.2.77 ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with the Main ID Register, MIDR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

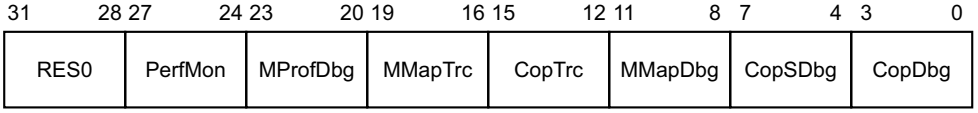
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_DFR0 is architecturally mapped to AArch64 System register ID_DFR0_EL1.

**Attributes**

ID_DFR0 is a 32-bit register.

#### Field descriptions

The ID_DFR0 bit assignments are:

**Bits [31:28]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PerfMon, bits [27:24]**

Performance Monitors. Support for coprocessor-based ARM Performance Monitors Extension, for A and R profile processors. Defined values are:

`0000` Performance Monitors Extension System registers not implemented.

`0001` Support for Performance Monitors Extension version 1 (PMUv1) System registers.

`0010` Support for Performance Monitors Extension version 2 (PMUv2) System registers.

`0011` Support for Performance Monitors Extension version 3 (PMUv3) System registers.

`1111` IMPLEMENTATION DEFINED form of Performance Monitors System registers supported. PMUv3 not supported.

All other values are reserved.

In ARMv8-A the permitted values are `0000`, `0011`, and `1111`.

In ARMv7, the value `0000` can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

**MProfDbg, bits [23:20]**

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

`0000` Not supported.

`0001` Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

`0000` Not supported.

`0001` Support for ARM trace architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `0001`.

In the Trace registers, the ETMIDR gives more information about the implementation.

**CopTrc, bits [15:12]**

Coprocessor Trace. Support for coprocessor-based trace model. Defined values are:

`0000` Not supported.

`0001` Support for ARM trace architecture, with CP14 access.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `0001`.

In the Trace registers, the ETMIDR gives more information about the implementation.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In ARMv8-A this field is RES0.

The optional memory map defined by ARMv8 is not compatible with ARMv7.

**CopSDbg, bits [7:4]**

Coprocessor Secure Debug. Support for a Secure debug model accessed through a conceptual coprocessor, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-Secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CopDbg, bits [3:0]**

Coprocessor Debug. Support for coprocessor based debug model, for A and R profile processors. Defined values are:

`0000` Not supported.

`0010` Support for ARMv6, v6 Debug architecture, with CP14 access.

`0011` Support for ARMv6, v6.1 Debug architecture, with CP14 access.

`0100` Support for ARMv7, v7 Debug architecture, with CP14 access.

`0101` Support for ARMv7, v7.1 Debug architecture, with CP14 access.

`0110` Support for ARMv8 debug architecture, with CP14 access.

All other values are reserved.

In ARMv8-A the permitted values are `0000`, and `0110`.

## Accessing the ID_DFR0:

To access the ID_DFR0:

```
MRC p15,0,<Rt>,c0,c1,2 ; Read ID_DFR0 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.78 ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

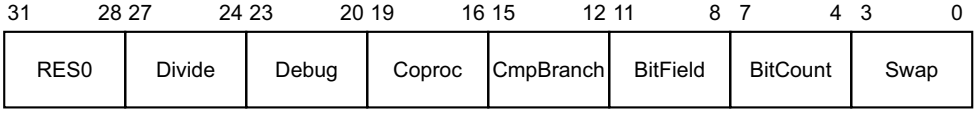
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_ISAR0 is architecturally mapped to AArch64 System register ID_ISAR0_EL1.

**Attributes**

ID_ISAR0 is a 32-bit register.

### Field descriptions

The ID_ISAR0 bit assignments are:

**Bits [31:28]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Divide, bits [27:24]**

Indicates the implemented Divide instructions. Defined values are:

0000 None implemented.

0001 Adds SDIV and UDIV in the T32 instruction set.

0010 As for 0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

**Debug, bits [23:20]**

Indicates the implemented Debug instructions. Defined values are:

0000 None implemented.

0001 Adds BKPT.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**Coproc, bits [19:16]**

Indicates the implemented Coprocessor instructions. Defined values are:

0000 None implemented, except for instructions separately attributed by the architecture, including CP15, CP14, and Advanced SIMD and VFP.

0001 Adds generic CDP, LDC, MCR, MRC, and STC.

0010 As for 0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.

0011 As for 0010, and adds generic MCRR and MRRC.

0100 As for 0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**CmpBranch, bits [15:12]**

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

0000 None implemented.

0001 Adds CBNZ and CBZ.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**BitField, bits [11:8]**

Indicates the implemented BitField instructions. Defined values are:

0000 None implemented.

0001 Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**BitCount, bits [7:4]**

Indicates the implemented Bit Counting instructions. Defined values are:

0000 None implemented.

0001 Adds CLZ.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Swap, bits [3:0]**

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

`0000` None implemented.

`0001` Adds SWP and SWPB.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

### Accessing the ID_ISAR0:

To access the ID_ISAR0:

```
MRC p15,0,<Rt>,c0,c2,0 ; Read ID_ISAR0 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.79 ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

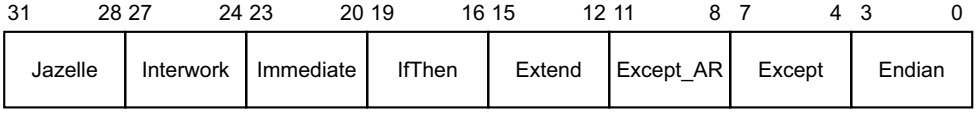
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_ISAR1 is architecturally mapped to AArch64 System register ID_ISAR1_EL1.

**Attributes**

ID_ISAR1 is a 32-bit register.

#### Field descriptions

The ID_ISAR1 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

`0000` No support for Jazelle.

`0001` Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:

`0000` None implemented.

`0001` Adds the BX instruction, and the T bit in the PSR.

`0010` As for `0001`, and adds the BLX instruction. PC loads have BX-like behavior.

`0011` As for `0010`, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In ARMv8-A the only permitted value is `0011`.

**Immediate, bits [23:20]**

Indicates the implemented data-processing instructions with long immediates. Defined values are:

`0000` None implemented.

`0001` Adds:

- The MOVT instruction.
- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**IfThen, bits [19:16]**

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

`0000` None implemented.

`0001` Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Extend, bits [15:12]**

Indicates the implemented Extend instructions. Defined values are:

`0000` No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.

`0001` Adds the SXTB, SXTH, UXTB, and UXTH instructions.

`0010` As for `0001`, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Except_AR, bits [11:8]**

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

`0000` None implemented.

`0001` Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Except, bits [7:4]**

Indicates the implemented exception-handling instructions in the ARM instruction set. Defined values are:

`0000` Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

`0001` Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Endian, bits [3:0]**

Indicates the implemented Endian instructions. Defined values are:

`0000` None implemented.

`0001` Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `0001`.

## Accessing the ID_ISAR1:

To access the ID_ISAR1:

```
MRC p15,0,<Rt>,c0,c2,1 ; Read ID_ISAR1 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.80 ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

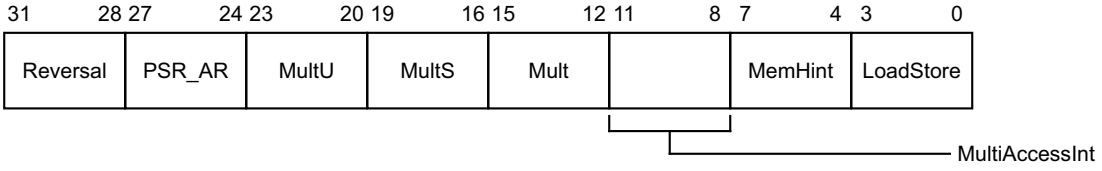
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_ISAR2 is architecturally mapped to AArch64 System register ID_ISAR2_EL1.

**Attributes**

ID_ISAR2 is a 32-bit register.

### Field descriptions

The ID_ISAR2 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

`0000` None implemented.

`0001` Adds the REV, REV16, and REVSH instructions.

`0010` As for `0001`, and adds the RBIT instruction.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

`0000` None implemented.

`0001` Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

**MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

`0000` None implemented.

`0001` Adds the UMULL and UMLAL instructions.

`0010` As for `0001`, and adds the UMAAL instruction.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

**MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

`0000` None implemented.

`0001` Adds the SMULL and SMLAL instructions.

`0010` As for `0001`, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.

`0011` As for `0010`, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0011`.

**Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

`0000` No additional instructions implemented. This means only MUL is implemented.

`0001` Adds the MLA instruction.

`0010` As for `0001`, and adds the MLS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:

`0000` No support. This means the LDM and STM instructions are not interruptible.

`0001` LDM and STM instructions are restartable.

`0010` LDM and STM instructions are continuable.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**MemHint, bits [7:4]**

Indicates the implemented Memory Hint instructions. Defined values are:

`0000` None implemented.

`0001` Adds the PLD instruction.

`0010` Adds the PLD instruction. (`0001` and `0010` have identical effects.)

`0011` As for `0001` (or `0010`), and adds the PLI instruction.

`0100` As for `0011`, and adds the PLDW instruction.

All other values are reserved.

In ARMv8-A the only permitted value is `0100`.

**LoadStore, bits [3:0]**

Indicates the implemented additional load/store instructions. Defined values are:

`0000` No additional load/store instructions implemented.

`0001` Adds the LDRD and STRD instructions.

`0010` As for `0001`, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

### Accessing the ID_ISAR2:

To access the ID_ISAR2:

```
MRC p15,0,<Rt>,c0,c2,2 ; Read ID_ISAR2 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.81 ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

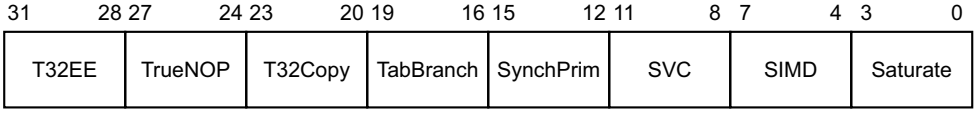
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_ISAR3 is architecturally mapped to AArch64 System register ID_ISAR3_EL1.

**Attributes**

ID_ISAR3 is a 32-bit register.

#### Field descriptions

The ID_ISAR3 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

`0000` None implemented.

`0001` Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:

`0000` None implemented. This means there are no NOP instructions that do not have any register dependencies.

`0001` Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**T32Copy, bits [23:20]**

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

`0000` Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

`0001` Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**TabBranch, bits [19:16]**

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

`0000` None implemented.

`0001` Adds the TBB and TBH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**SynchPrim, bits [15:12]**

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

`0000` If SynchPrim_frac == `0000`, no Synchronization Primitives implemented.

`0001` If SynchPrim_frac == `0000`, adds the LDREX and STREX instructions.
If SynchPrim_frac == `0011`, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.

`0010` If SynchPrim_frac == `0000`, as for [`0001`, `0011`] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is `0010`.

**SVC, bits [11:8]**

Indicates the implemented SVC instructions. Defined values are:

`0000` Not implemented.

`0001` Adds the SVC instruction.

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In ARMv8-A the only permitted value is 0001.

**SIMD, bits [7:4]**

Indicates the implemented SIMD instructions. Defined values are:

0000 None implemented.

0001 Adds the SSAT and USAT instructions, and the Q bit in the PSRs.

0011 As for 0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

**Saturate, bits [3:0]**

Indicates the implemented Saturate instructions. Defined values are:

0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.

0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the ID_ISAR3:

To access the ID_ISAR3:

```
MRC p15,0,<Rt>,c0,c2,3 ; Read ID_ISAR3 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0010 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.82 ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

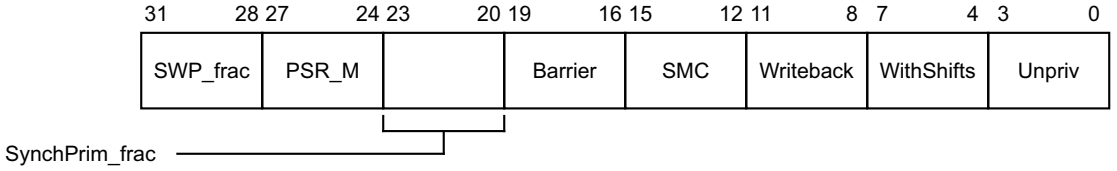
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_ISAR4 is architecturally mapped to AArch64 System register ID_ISAR4_EL1.

**Attributes**

ID_ISAR4 is a 32-bit register.

### Field descriptions

The ID_ISAR4 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

`0000` SWP or SWPB instructions not implemented.

`0001` SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the ID_ISAR0.Swap_instrs field is `0000`.

In ARMv8-A the only permitted value is `0000`.

**PSR_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

`0000` None implemented.

`0001` Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

`0000` If SynchPrim == `0000`, no Synchronization Primitives implemented. If SynchPrim == `0001`, adds the LDREX and STREX instructions. If SynchPrim == `0010`, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.

`0011` If SynchPrim == `0001`, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is `0000`.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

`0000` None implemented. Barrier operations are provided only as CP15 operations.

`0001` Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

`0000` None implemented.

`0001` Adds the SMC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

`0000` Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.

`0001` Adds support for all of the writeback addressing modes.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:

0000 Nonzero shifts supported only in MOV and shift instructions.

0001 Adds support for shifts of loads and stores over the range LSL 0-3.

0011 As for 0001, and adds support for other constant shift options, both on load/store and other instructions.

0100 As for 0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

**Unpriv, bits [3:0]**

Indicates the implemented unprivileged instructions. Defined values are:

0000 None implemented. No T variant instructions are implemented.

0001 Adds the LDRBT, LDRT, STRBT, and STRT instructions.

0010 As for 0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

### Accessing the ID_ISAR4:

To access the ID_ISAR4:

```
MRC p15,0,<Rt>,c0,c2,4 ; Read ID_ISAR4 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0010 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.83 ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

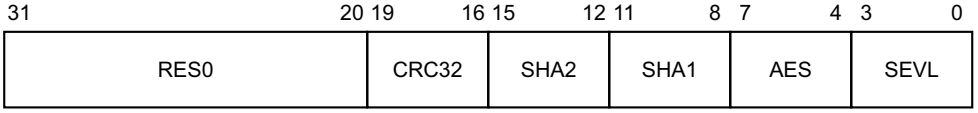
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_ISAR5 is architecturally mapped to AArch64 System register ID_ISAR5_EL1.

**Attributes**

ID_ISAR5 is a 32-bit register.

#### Field descriptions

The ID_ISAR5 bit assignments are:

**Bits [31:20]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CRC32, bits [19:16]**

Indicates whether CRC32 instructions are implemented in AArch32.

0000 No CRC32 instructions implemented.

0001 CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

**SHA2, bits [15:12]**

Indicates whether SHA2 instructions are implemented in AArch32.

0000 No SHA2 instructions implemented.

0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

**SHA1, bits [11:8]**

Indicates whether SHA1 instructions are implemented in AArch32.

0000 No SHA1 instructions implemented.

0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

**AES, bits [7:4]**

Indicates whether AES instructions are implemented in AArch32.

0000 No AES instructions implemented.

0001 AESE, AESD, AESMC, and AESIMC implemented.

0010 As for 0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

**SEVL, bits [3:0]**

Indicates whether the SEVL instruction is implemented in AArch32.

0000 SEVL is implemented as a NOP.

0001 SEVL is implemented as Send Event Local.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### Accessing the ID_ISAR5:

To access the ID_ISAR5:

```
MRC p15,0,<Rt>,c0,c2,5 ; Read ID_ISAR5 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|

### G6.2.84 ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_MMFR1, ID_MMFR2, and ID_MMFR3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

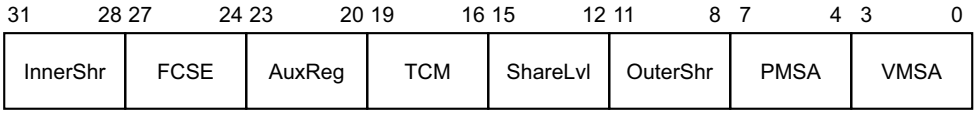
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_MMFR0 is architecturally mapped to AArch64 System register ID_MMFR0_EL1.

**Attributes**

ID_MMFR0 is a 32-bit register.

#### Field descriptions

The ID_MMFR0 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

`0000` Implemented as Non-cacheable.

`0001` Implemented with hardware coherency support.

`1111` Shareability ignored.

All other values are reserved.

In ARMv8-A the permitted values are `0000`, `0001`, and `1111`.

This field is valid only if the implementation distinguishes between Inner Shareable and Outer Shareable, by implementing two levels of shareability, as indicated by the value of the Shareability levels field, bits[15:12].

When the Shareability level field is zero, this field is UNK.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

`0000` Not supported.

`0001` Support for FCSE.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

`0000` None supported.

`0001` Support for Auxiliary Control Register only.

`0010` Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

**Note**

Accesses to unimplemented Auxiliary registers are UNDEFINED.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

`0000` Not supported.

`0001` Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.

`0010` Support for TCM only, ARMv6 implementation.

`0011` Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

`0000` One level of shareability implemented.

`0001` Two levels of shareability implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**OuterShr, bits [11:8]**

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

`0000` Implemented as Non-cacheable.

`0001` Implemented with hardware coherency support.

`1111` Shareability ignored.

All other values are reserved.

In ARMv8-A the permitted values are `0000`, `0001`, and `1111`.

**PMSA, bits [7:4]**

Indicates support for a PMSA. Defined values are:

`0000` Not supported.

`0001` Support for IMPLEMENTATION DEFINED PMSA.

`0010` Support for PMSAv6, with a Cache Type Register implemented.

`0011` Support for PMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**VMSA, bits [3:0]**

Indicates support for a VMSA. Defined values are:

`0000` Not supported.

`0001` Support for IMPLEMENTATION DEFINED VMSA.

`0010` Support for VMSAv6, with Cache and TLB Type Registers implemented.

`0011` Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.

`0100` As for `0011`, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.

`0101` As for `0100`, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In ARMv8-A the only permitted value is `0101`.

### Accessing the ID_MMFR0:

To access the ID_MMFR0:

```
MRC p15,0,<Rt>,c0,c1,4 ; Read ID_MMFR0 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.85 ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_MMFR0, ID_MMFR2, and ID_MMFR3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

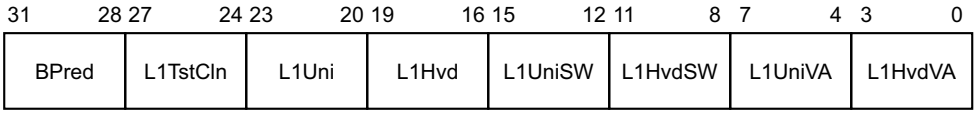
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_MMFR1 is architecturally mapped to AArch64 System register ID_MMFR1_EL1.

**Attributes**

ID_MMFR1 is a 32-bit register.

### Field descriptions

The ID_MMFR1 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**BPred, bits [31:28]**

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

`0000` No branch predictor, or no MMU present. Implies a fixed MPU configuration.

`0001` Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Changes to the TTBR0, TTBR1, or TTBCR registers.
- Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.

`0010` Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.

`0011` Branch predictor requires flushing only on writing new data to instruction locations.

`0100` For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In ARMv8-A the permitted values are `0010`, `0011`, or `0100`. For values other than `0000` and `0100` the ARM Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

**L1TstCln, bits [27:24]**

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

`0000` None supported.

`0001` Supported Level 1 data cache test and clean operations are:

- Test and clean data cache.

`0010` As for `0001`, and adds:

- Test, clean, and invalidate data cache.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**L1Uni, bits [23:20]**

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations, for a unified cache implementation. Defined values are:

`0000` None supported.

`0001` Supported entire Level 1 cache operations are:

- Invalidate cache, including branch predictor if appropriate.
- Invalidate branch predictor, if appropriate.

`0010` As for `0001`, and adds:

- Clean cache, using a recursive model that uses the cache dirty status bit.
- Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**L1Hvd, bits [19:16]**

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations, for a Harvard cache implementation. Defined values are:

`0000` None supported.

`0001` Supported entire Level 1 cache operations are:

- Invalidate instruction cache, including branch predictor if appropriate.
- Invalidate branch predictor, if appropriate.

`0010` As for `0001`, and adds:

- Invalidate data cache.
- Invalidate data cache and instruction cache, including branch predictor if appropriate.

`0011` As for `0010`, and adds:

- Clean data cache, using a recursive model that uses the cache dirty status bit.
- Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**L1UniSW, bits [15:12]**

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

`0000` None supported.

`0001` Supported Level 1 unified cache line maintenance operations by set/way are:

- Clean cache line by set/way.

`0010` As for `0001`, and adds:

- Clean and invalidate cache line by set/way.

`0011` As for `0010`, and adds:

- Invalidate cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**L1HvdSW, bits [11:8]**

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

`0000` None supported.

`0001` Supported Level 1 Harvard cache line maintenance operations by set/way are:

- Clean data cache line by set/way.
- Clean and invalidate data cache line by set/way.

`0010` As for `0001`, and adds:

- Invalidate data cache line by set/way.

`0011` As for `0010`, and adds:

- Invalidate instruction cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**L1UniVA, bits [7:4]**

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

`0000` None supported.

`0001` Supported Level 1 unified cache line maintenance operations by VA are:

- Clean cache line by VA.
- Invalidate cache line by VA.
- Clean and invalidate cache line by VA.

`0010` As for `0001`, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**L1HvdVA, bits [3:0]**

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

`0000` None supported.

`0001` Supported Level 1 Harvard cache line maintenance operations by VA are:

- Clean data cache line by VA.
- Invalidate data cache line by VA.
- Clean and invalidate data cache line by VA.
- Clean instruction cache line by VA.

`0010` As for `0001`, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

## Accessing the ID_MMFR1:

To access the ID_MMFR1:

```
MRC p15,0,<Rt>,c0,c1,5 ; Read ID_MMFR1 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.86 ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_MMFR0, ID_MMFR1, and ID_MMFR3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

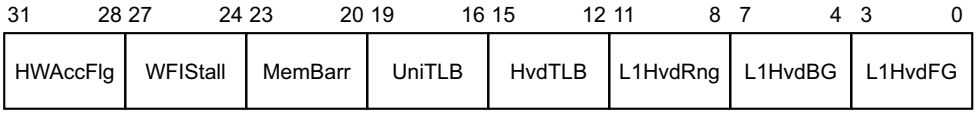
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_MMFR2 is architecturally mapped to AArch64 System register ID_MMFR2_EL1.

**Attributes**

ID_MMFR2 is a 32-bit register.

### Field descriptions

The ID_MMFR2 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the ARM Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

`0000` Not supported.

`0001` Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

`0000` Not supported.

`0001` Support for WFI stalling.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `0001`.

**MemBarr, bits [23:20]**

Memory Barrier. Indicates the supported CP15 memory barrier operations:

`0000` None supported.

`0001` Supported CP15 Memory barrier operations are:

- Data Synchronization Barrier (DSB), which in previous versions of the ARM architecture was named Data Write Barrier (DWB).

`0010` As for `0001`, and adds:

- Instruction Synchronization Barrier (ISB), which in previous versions of the ARM architecture was called Prefetch Flush.
- Data Memory Barrier (DMB).

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

ARM deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

**UniTLB, bits [19:16]**

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

`0000` Not supported.

`0001` Supported unified TLB maintenance operations are:

- Invalidate all entries in the TLB.
- Invalidate TLB entry by VA.

`0010` As for `0001`, and adds:

- Invalidate TLB entries by ASID match.

`0011` As for `0010`, and adds:

- Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.

`0100` As for `0011`, and adds:

- Invalidate Hyp mode unified TLB entry by VA.
- Invalidate entire Non-secure PL1&0 unified TLB.
- Invalidate entire Hyp mode unified TLB.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

0101 As for 0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.

0110 As for 0101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In ARMv8-A the only permitted value is 0110.

**HvdTLB, bits [15:12]**

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

**L1HvdRng, bits [11:8]**

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

0000 Not supported.

0001 Supported Level 1 Harvard cache maintenance range operations are:

- Invalidate data cache range by VA.
- Invalidate instruction cache range by VA.
- Clean data cache range by VA.
- Clean and invalidate data cache range by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**L1HvdBG, bits [7:4]**

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

0000 Not supported.

0001 Supported Level 1 Harvard cache background fetch operations are:

- Fetch instruction cache range by VA.
- Fetch data cache range by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**L1HvdFG, bits [3:0]**

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

0000 Not supported.

0001 Supported Level 1 Harvard cache foreground fetch operations are:

- Fetch instruction cache range by VA.
- Fetch data cache range by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

## Accessing the ID_MMFR2:

To access the ID_MMFR2:

```
MRC p15,0,<Rt>,c0,c1,6 ; Read ID_MMFR2 into Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 110 |

## G6.2.87 ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_MMFR0, ID_MMFR1, and ID_MMFR2.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

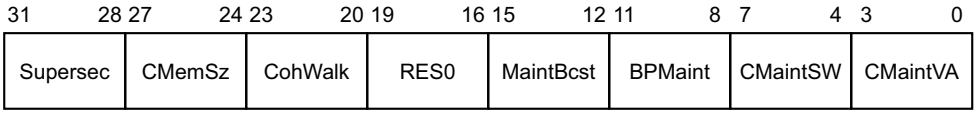
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_MMFR3 is architecturally mapped to AArch64 System register ID_MMFR3_EL1.

**Attributes**

ID_MMFR3 is a 32-bit register.

### Field descriptions

The ID_MMFR3 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

`0000` Supersections supported.

`1111` Supersections not supported.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `1111`.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

`0000` 4GB, corresponding to a 32-bit physical address range.

`0001` 64GB, corresponding to a 36-bit physical address range.

`0010` 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In ARMv8-A the permitted values are `0000`, `0001`, and `0010`.

**CohWalk, bits [23:20]**

Coherent Walk. Indicates whether Translation table updates require a clean to the point of unification. Defined values are:

`0000` Updates to the translation tables require a clean to the point of unification to ensure visibility by subsequent translation table walks.

`0001` Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Bits [19:16]**

Reserved, RES0.

**MaintBcst, bits [15:12]**

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

`0000` Cache, TLB, and branch predictor operations only affect local structures.

`0001` Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.

`0010` Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

**BPMaint, bits [11:8]**

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations, Defined values are:

`0000` None supported.

`0001` Supported branch predictor maintenance operations are:

- Invalidate all branch predictors.

`0010` As for `0001`, and adds:

- Invalidate branch predictors by VA.

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In ARMv8-A the only permitted value is 0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

0000 None supported.

0001 Supported hierarchical cache maintenance instructions by set/way are:

- Invalidate data cache by set/way.
- Clean data cache by set/way.
- Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, the data cache maintenance instructions apply to the unified caches.

**CMaintVA, bits [3:0]**

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

0000 None supported.

0001 Supported hierarchical cache maintenance instructions by VA are:

- Invalidate data cache by VA.
- Clean data cache by VA.
- Clean and invalidate data cache by VA.
- Invalidate instruction cache by VA.
- Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, data cache maintenance instructions apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

### Accessing the ID_MMFR3:

To access the ID_MMFR3:

```
MRC p15,0,<Rt>,c0,c1,7 ; Read ID_MMFR3 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.88 ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If EL2 is using AArch32 and HCR.TID3==1 then:

- If the register is not RAZ/WI then Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- Otherwise, it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If EL2 is using AArch64 and HCR_EL2.TID3==1 then:

- If the register is not RAZ/WI then Non-secure EL1 read accesses to this register are trapped to EL2.
- Otherwise, it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

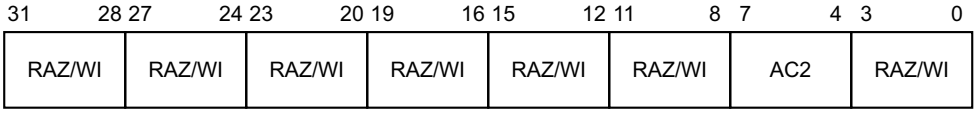
If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_MMFR4 is architecturally mapped to AArch64 System register ID_MMFR4_EL1.

In an implementation that does not include ACTLR2 and HACTLR2 this register is RAZ/WI.



**Attributes**

ID_MMFR4 is a 32-bit register.

#### Field descriptions

The ID_MMFR4 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**AC2, bits [7:4]**

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

`0000` ACTLR2 and HACTLR2 are not implemented.

`0001` ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `0001`.

## Accessing the ID_MMFR4:

To access the ID_MMFR4:

```
MRC p15,0,<Rt>,c0,c2,6 ; Read ID_MMFR4 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0010 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.89 ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

**Purpose**

Gives top-level information about the instruction sets supported by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_PFR1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

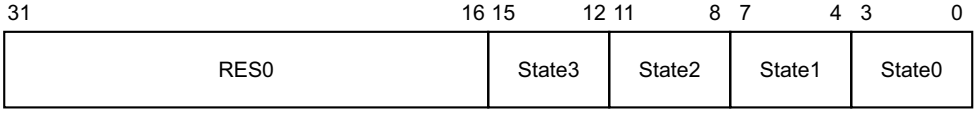
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_PFR0 is architecturally mapped to AArch64 System register ID_PFR0_EL1.

**Attributes**

ID_PFR0 is a 32-bit register.

#### Field descriptions

The ID_PFR0 bit assignments are:

**Bits [31:16]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**State3, bits [15:12]**

T32EE instruction set support. Defined values are:

0000 Not implemented.

0001 T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**State2, bits [11:8]**

Jazelle extension support. Defined values are:

0000 Not implemented.

0001 Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.

0010 Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**State1, bits [7:4]**

T32 instruction set support. Defined values are:

0000 T32 instruction set not implemented.

0001 T32 encodings before the introduction of Thumb-2 technology implemented:

- All instructions are 16-bit.
- A BL or BLX is a pair of 16-bit instructions.
- 32-bit instructions other than BL and BLX cannot be encoded.

0011 T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

**State0, bits [3:0]**

A32 instruction set support. Defined values are:

0000 A32 instruction set not implemented.

0001 A32 instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the ID_PFR0:

To access the ID_PFR0:

```
MRC p15,0,<Rt>,c0,c1,0 ; Read ID_PFR0 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.90 ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

Must be interpreted with ID_PFR0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

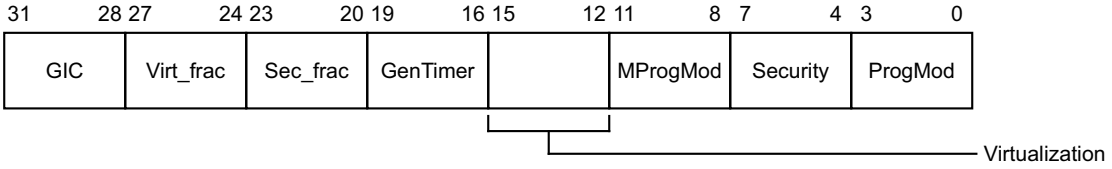
If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ID_PFR1 is architecturally mapped to AArch64 System register ID_PFR1_EL1.

**Attributes**

ID_PFR1 is a 32-bit register.

### Field descriptions

The ID_PFR1 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**GIC, bits [31:28]**

System register GIC CPU interface. Defined values are:

`0000` No System register interface to the GIC CPU interface is supported.

`0001` System register interface to the GIC CPU interface is supported.

All other values are reserved.

**Virt_frac, bits [27:24]**

Virtualization fractional field. When the Virtualization field is `0000`, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

`0000` No features from the ARMv7 Virtualization Extensions are implemented.

`0001` The following features of the ARMv7 Virtualization Extensions are implemented:

- The SCR.SIF bit, if EL3 is implemented.
- The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.
- The MSR (Banked register) and MRS (Banked register) instructions.
- The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are `0000` and `0001`.

**Note**

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

This field is only valid when ID_PFR1[15:12] == 0, otherwise it holds the value `0000`.

**Sec_frac, bits [23:20]**

Security fractional field. When the Security field is `0000`, determines the support for features from the ARMv7 Security Extensions. Defined values are:

`0000` No features from the ARMv7 Security Extensions are implemented.

`0001` The following features from the ARMv7 Security Extensions are implemented:

- The VBAR register.
- The TTBCR.PD0 and TTBCR.PD1 bits.

`0010` As for `0001`, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In ARMv8-A the permitted values are `0000`, `0001`, and `0010`.

This field is only valid when ID_PFR1[7:4] == 0, otherwise it holds the value `0000`.

**GenTimer, bits [19:16]**

Generic Timer support. Defined values are:

`0000` Not implemented.

`0001` Generic Timer implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

`0000` EL2, Hyp mode, and the HVC instruction not implemented.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

0001 EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0001 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

**Note**

The ID_ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

0000 Not supported.

0010 Support for two-stack programmers' model.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**Security, bits [7:4]**

Security support. Defined values are:

0000 EL3, Monitor mode, and the SMC instruction not implemented.

0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0001 implemented.

0010 As for 0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

**ProgMod, bits [3:0]**

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

0000 Not supported.

0001 Supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the ID_PFR1:

To access the ID_PFR1:

```
MRC p15,0,<Rt>,c0,c1,1 ; Read ID_PFR1 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0001 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.91 IFAR, Instruction Fault Address Register

The IFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

IFAR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

IFAR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

IFAR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T6==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T6==1, Non-secure EL1 accesses to this register are trapped to EL2.

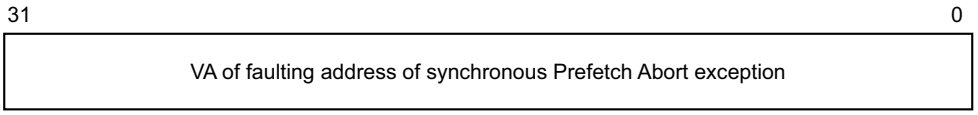
**Configurations**

AArch32 System register IFAR(NS) is architecturally mapped to AArch64 System register FAR_EL1[63:32].

AArch32 System register IFAR(S) is architecturally mapped to AArch32 System register HIFAR when EL2 is implemented.

AArch32 System register IFAR(S) is architecturally mapped to AArch64 System register FAR_EL2[63:32] when EL2 is implemented.

RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

IFAR is a 32-bit register.

## Field descriptions

The IFAR bit assignments are:

**Bits [31:0]**

VA of faulting address of synchronous Prefetch Abort exception.

## Accessing the IFAR:

To access the IFAR:

```
MRC p15,0,<Rt>,c6,c0,2 ; Read IFAR into Rt
MCR p15,0,<Rt>,c6,c0,2 ; Write Rt to IFAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0110 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.92 IFSR, Instruction Fault Status Register

The IFSR characteristics are:

**Purpose**

Holds status information about the last instruction fault.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

IFSR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

IFSR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

IFSR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

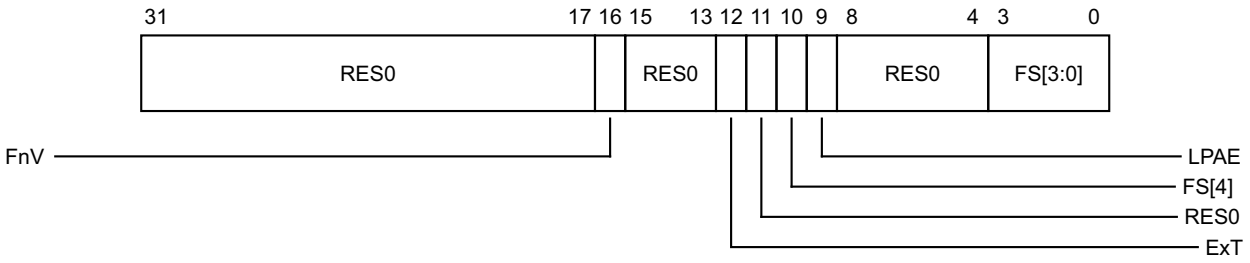
**Configurations**

AArch32 System register IFSR is architecturally mapped to AArch64 System register IFSR32_EL2.

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**



IFSR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The IFSR bit assignments are:

***When TTBCR.EAE==0:***

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

`0` IFAR is valid.

`1` IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

**Bits [15:13]**

Reserved, RES0.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

For aborts other than external aborts this bit always returns 0.

**Bit [11]**

Reserved, RES0.

**FS[4], bit [10]**

See FS[3:0], bits [3:0] for description of the FS field.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

`0` Using the Short-descriptor translation table formats.

`1` Using the Long-descriptor translation table formats.

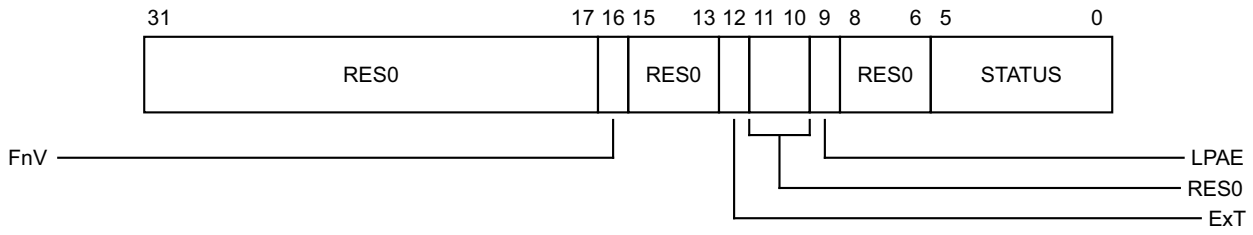
Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**Bits [8:4]**

Reserved, RES0.

**FS[3:0], bits [3:0]**

Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:



`00001` PC alignment fault

| 01110 | Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 2 |
| 01111 | Permission fault, level 2 |
| 10000 | TLB conflict abort |
| 10100 | IMPLEMENTATION DEFINED fault (Lockdown fault) |
| 11001 | Synchronous parity or ECC error on memory access, not on translation table walk |
| 11100 | Synchronous parity or ECC error on translation table walk, level 1 |
| 11110 | Synchronous parity or ECC error on translation table walk, level 2 |

All other values are reserved.

***When TTBCR.EAE==1:***

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

| | |
|---|---|
| 0 | IFAR is valid. |
| 1 | IFAR is not valid, and holds an UNKNOWN value. |

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

**Bits [15:13]**

Reserved, RES0.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For aborts other than external aborts this bit always returns 0.

**Bits [11:10]**

Reserved, RES0.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

`0` Using the Short-descriptor translation table formats.

`1` Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

`000000` Address size fault in TTBR0 or TTBR1

`000001` Address size fault, level 1

`000010` Address size fault, level 2

`000011` Address size fault, level 3

`000101` Translation fault, level 1

`000110` Translation fault, level 2

`000111` Translation fault, level 3

`001001` Access flag fault, level 1

`001010` Access flag fault, level 2

`001011` Access flag fault, level 3

`001101` Permission fault, level 1

`001110` Permission fault, level 2

`001111` Permission fault, level 3

`010000` Synchronous external abort, other than synchronous parity or ECC error, not on translation table walk

`010101` Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 1

`010110` Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 2

`010111` Synchronous external abort, other than synchronous parity or ECC error, on translation table walk, level 3

`011000` Synchronous parity or ECC error on memory access, not on translation table walk

`011101` Synchronous parity or ECC error on memory access on translation table walk, level 1

`011110` Synchronous parity or ECC error on memory access on translation table walk, level 2

`011111` Synchronous parity or ECC error on memory access on translation table walk, level 3

`100001` Alignment fault

`100010` Debug event

`110000` TLB conflict abort

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

### Accessing the IFSR:

To access the IFSR:

```
MRC p15,0,<Rt>,c5,c0,1 ; Read IFSR into Rt
MCR p15,0,<Rt>,c5,c0,1 ; Write Rt to IFSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0101 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.93 ISR, Interrupt Status Register

The ISR characteristics are:

**Purpose**

Shows whether an IRQ, FIQ, or external abort is pending. If EL2 is implemented, an indicated pending abort might be a physical abort or a virtual abort.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

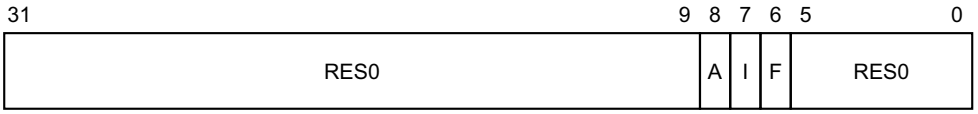
Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register ISR is architecturally mapped to AArch64 System register ISR_EL1.

**Attributes**

ISR is a 32-bit register.

## Field descriptions

The ISR bit assignments are:

**Bits [31:9]**

Reserved, RES0.

**A, bit [8]**

Asynchronous external abort pending bit:

0 No pending asynchronous external abort.

Non-Confidential - Beta

1 An asynchronous external abort is pending.

**I, bit [7]**

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

0 No pending IRQ.

1 An IRQ interrupt is pending.

**F, bit [6]**

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

0 No pending FIQ.

1 An FIQ interrupt is pending.

**Bits [5:0]**

Reserved, RES0.

### Accessing the ISR:

To access the ISR:

```
MRC p15,0,<Rt>,c12,c1,0 ; Read ISR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1100 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.94 ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

**Purpose**

Invalidate all instruction TLB entries for the PL1&0 translation regime, subject to the Privilege level and Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIALL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

ITLBIALL is a 32-bit system operation.

#### Field descriptions

The ITLBIALL operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the ITLBIALL operation:

To perform the ITLBIALL operation:

```
MCR p15,0,<Rt>,c8,c5,0 ; ITLBIALL operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.95 ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

**Purpose**

Invalidate instruction TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIASID.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

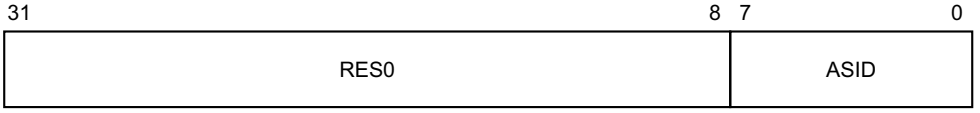
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ITLBIASID is a 32-bit system operation.

#### Field descriptions

The ITLBIASID input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Performing the ITLBIASID operation:

To perform the ITLBIASID operation:

```
MCR p15,0,<Rt>,c8,c5,2 ; ITLBIASID operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0101 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.96 ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime stage 1 that match the given VA and ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVA.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

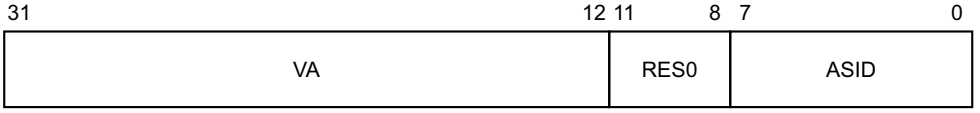
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

ITLBIMVA is a 32-bit system operation.

### Field descriptions

The ITLBIMVA input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Performing the ITLBIMVA operation:

To perform the ITLBIMVA operation:

```
MCR p15,0,<Rt>,c8,c5,1 ; ITLBIMVA operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.97 JIDR, Jazelle ID Register

The JIDR characteristics are:

**Purpose**

A Jazelle register, which identified the Jazelle architecture version.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| IMP DEF | IMP DEF | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| IMP DEF | RO | RO |

For EL0 using AArch32, it is IMPLEMENTATION DEFINED whether JIDR is RAZ or UNDEFINED.

**Traps and Enables**

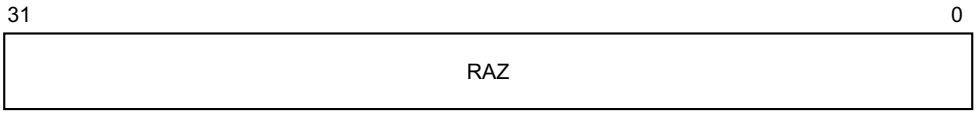
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID0==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID0==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

JIDR is a 32-bit register.

#### Field descriptions

The JIDR bit assignments are:

**Bits [31:0]**

Reserved, RAZ.

#### Accessing the JIDR:

To access the JIDR:

```
MRC p14,7,<Rt>,c0,c0,0 ; Read JIDR into Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 111 | 0000 | 0000 | 000 |

### G6.2.98 JMCR, Jazelle Main Configuration Register

The JMCR characteristics are:

**Purpose**

A Jazelle register, which provides control of the Jazelle extension.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| IMP DEF | IMP DEF | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| IMP DEF | RW | RW |

For EL0 using AArch32, it is IMPLEMENTATION DEFINED whether JMCR is RAZ/WI or UNDEFINED.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

JMCR is a 32-bit register.

#### Field descriptions

The JMCR bit assignments are:

**Bits [31:0]**

Reserved, RAZ/WI.

#### Accessing the JMCR:

To access the JMCR:

```
MRC p14,7,<Rt>,c2,c0,0 ; Read JMCR into Rt
MCR p14,7,<Rt>,c2,c0,0 ; Write Rt to JMCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 111 | 0010 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.99 JOSCR, Jazelle OS Control Register

The JOSCR characteristics are:

**Purpose**

A Jazelle register, which provides operating system control of the Jazelle Extension.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| IMP DEF | IMP DEF | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

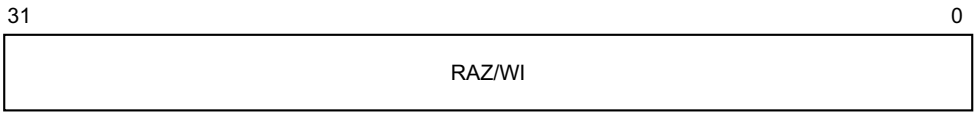
| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| IMP DEF | RW | RW |

For EL0 using AArch32, it is IMPLEMENTATION DEFINED whether JOSCR is RAZ/WI or UNDEFINED.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

JOSCR is a 32-bit register.

#### Field descriptions

The JOSCR bit assignments are:

**Bits [31:0]**

Reserved, RAZ/WI.

#### Accessing the JOSCR:

To access the JOSCR:

```
MRC p14,7,<Rt>,c1,c0,0 ; Read JOSCR into Rt
MCR p14,7,<Rt>,c1,c0,0 ; Write Rt to JOSCR
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 111 | 0001 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## G6.2.100 MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

**Purpose**

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

MAIR0(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

MAIR0(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

MAIR0 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

AttrIndx[2], from the translation table descriptor, selects the appropriate MAIR: setting AttrIndx[2] to 0 selects MAIR0.

In an implementation that includes EL3:

- MAIR0(S) gives the value for memory accesses from Secure state.
- MAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

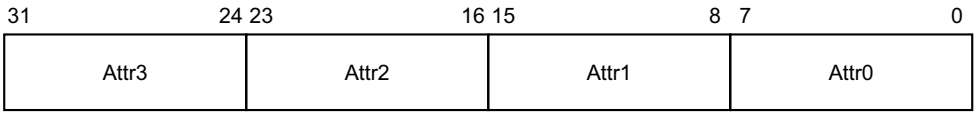
**Configurations**

AArch32 System register MAIR0 is architecturally mapped to AArch64 System register MAIR_EL1[31:0].

MAIR0 and PRRR are the same register.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

MAIR0 is a 32-bit register.

## Field descriptions

The MAIR0 bit assignments are:

***When TTBCR.EAE==1:***

**Attr<n>, bits [8n+7:8n], for n = 0 to 3**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|---|---|
| `0000` | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| `00RW`, RW not `00` | Normal Memory, Outer Write-through transient |
| `0100` | Normal Memory, Outer Non-cacheable |
| `01RW`, RW not `00` | Normal Memory, Outer Write-back transient |
| `10RW` | Normal Memory, Outer Write-through non-transient |
| `11RW` | Normal Memory, Outer Write-back non-transient |

R = Outer Read Allocate Policy, W = Outer Write Allocate Policy.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0000 | Meaning when Attr<n>[7:4] is not 0000 |
|---|---|---|
| 0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 00RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through transient |
| 0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 01RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back transient |
| 1000 | Device-nGRE memory | Normal Memory, Inner Write-through non-transient (RW=00) |
| 10RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through non-transient |
| 1100 | Device-GRE memory | Normal Memory, Inner Write-back non-transient (RW=00) |
| 11RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back non-transient |

R = Inner Read Allocate Policy, W = Inner Write Allocate Policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|---|---|
| 0 | Do not allocate |
| 1 | Allocate |

### Accessing the MAIR0:

To access the MAIR0 when TTBCR.EAE==1:

```
MRC p15,0,<Rt>,c10,c2,0 ; Read MAIR0 into Rt
MCR p15,0,<Rt>,c10,c2,0 ; Write Rt to MAIR0
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1010 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.101 MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

**Purpose**

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

MAIR1(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

MAIR1(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

MAIR1 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

AttrIndx[2], from the translation table descriptor, selects the appropriate MAIR: setting AttrIndx[2] to 1 selects MAIR1.

In an implementation that includes EL3:

- MAIR1(S) gives the value for memory accesses from Secure state.
- MAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

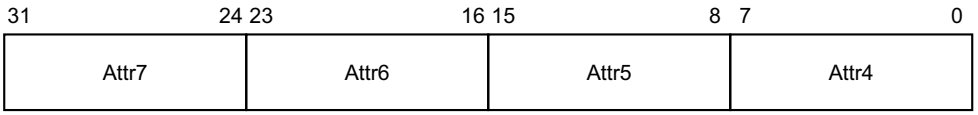
**Configurations**

AArch32 System register MAIR1 is architecturally mapped to AArch64 System register MAIR_EL1[63:32].

MAIR1 and NMRR are the same register.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

MAIR1 is a 32-bit register.

## Field descriptions

The MAIR1 bit assignments are:

***When TTBCR.EAE==1:***

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|---|---|
| `0000` | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| `00RW`, RW not `00` | Normal Memory, Outer Write-through transient |
| `0100` | Normal Memory, Outer Non-cacheable |
| `01RW`, RW not `00` | Normal Memory, Outer Write-back transient |
| `10RW` | Normal Memory, Outer Write-through non-transient |
| `11RW` | Normal Memory, Outer Write-back non-transient |

R = Outer Read Allocate Policy, W = Outer Write Allocate Policy.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0000 | Meaning when Attr<n>[7:4] is not 0000 |
|---|---|---|
| 0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 00RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through transient |
| 0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 01RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back transient |
| 1000 | Device-nGRE memory | Normal Memory, Inner Write-through non-transient (RW=00) |
| 10RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through non-transient |
| 1100 | Device-GRE memory | Normal Memory, Inner Write-back non-transient (RW=00) |
| 11RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back non-transient |

R = Inner Read Allocate Policy, W = Inner Write Allocate Policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|---|---|
| 0 | Do not allocate |
| 1 | Allocate |

### Accessing the MAIR1:

To access the MAIR1 when TTBCR.EAE==1:

```
MRC p15,0,<Rt>,c10,c2,1 ; Read MAIR1 into Rt
MCR p15,0,<Rt>,c10,c2,1 ; Write Rt to MAIR1
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1010 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.102 MIDR, Main ID Register

The MIDR characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

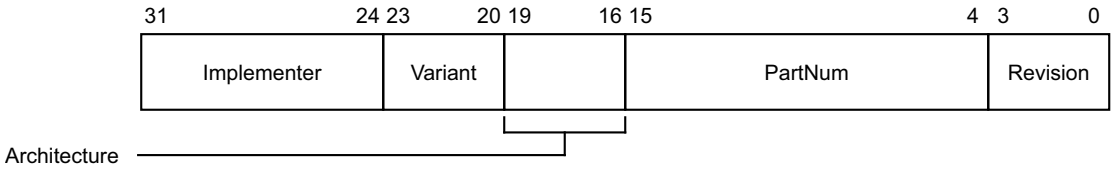
If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MIDR is architecturally mapped to AArch64 System register MIDR_EL1.

AArch32 System register MIDR is architecturally mapped to External register MIDR_EL1.



Some fields of the MIDR are IMPLEMENTATION DEFINED. For details of the values of these fields for a particular ARMv8 implementation, and any implementation-specific significance of these values, see the product documentation.

**Attributes**

MIDR is a 32-bit register.

### Field descriptions

The MIDR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

| Hex representation | ASCII representation | Implementer |
|---|---|---|
| 0x41 | A | ARM Limited |
| 0x42 | B | Broadcom Corporation |
| 0x43 | C | Cavium Inc. |
| 0x44 | D | Digital Equipment Corporation |
| 0x49 | I | Infineon Technologies AG |
| 0x4D | M | Motorola or Freescale Semiconductor Inc. |
| 0x4E | N | NVIDIA Corporation |
| 0x50 | P | Applied Micro Circuits Corporation |
| 0x51 | Q | Qualcomm Inc. |
| 0x56 | V | Marvell International Ltd. |
| 0x69 | i | Intel Corporation |

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

The permitted values of this field are:

0001 ARMv4

0010 ARMv4T

0011 ARMv5 (obsolete)

0100 ARMv5T

0101 ARMv5TE

0110 ARMv5TEJ

0111 ARMv6

1111 Architectural features are individually identified in the ID_* registers, see *Identification registers, functional group* on page G4-4162.

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the MIDR:

To access the MIDR:

```
MRC p15,0,<Rt>,c0,c0,0 ; Read MIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.103 MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

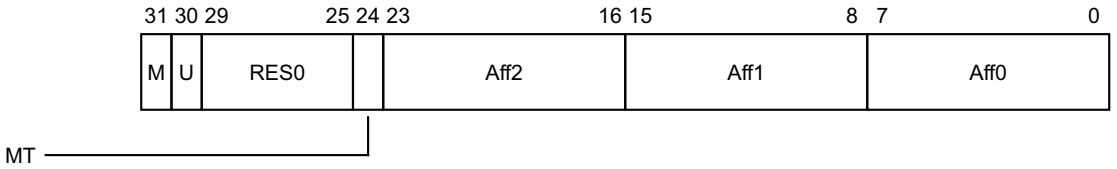
If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MPIDR is architecturally mapped to AArch64 System register MPIDR_EL1.

The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.



In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR is a 32-bit register.

#### Field descriptions

The MPIDR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.

1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.

In ARMv8 this bit is RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

0 Processor is part of a multiprocessor system.

1 Processor is part of a uniprocessor system.

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. The possible values of this bit are:

0 Performance of PEs at the lowest affinity level is largely independent.

1 Performance of PEs at the lowest affinity level is very interdependent.

**Aff2, bits [23:16]**

Affinity level 2. The least significant affinity level field, for this PE in the system.

**Aff1, bits [15:8]**

Affinity level 1. The intermediate affinity level field, for this PE in the system.

**Aff0, bits [7:0]**

Affinity level 0. The most significant affinity level field, for this PE in the system.

## Accessing the MPIDR:

To access the MPIDR:

```
MRC p15,0,<Rt>,c0,c0,5 ; Read MPIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0000 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.104 MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|---|
| - | - | - | RW | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

If EL3 is implemented and is using AArch64, any read or write to MVBAR from Secure EL1 using AArch32 is trapped as an exception to EL3.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

When EL3 is using AArch32, write access to MVBAR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

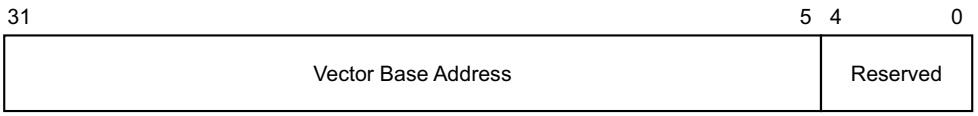
On a reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN.
- MVBAR[4:1] = RES0.
- MVBAR[0] = 0.

And:

- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address.
- MVBAR[0] = 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



**Attributes**

MVBAR is a 32-bit register.

## Field descriptions

The MVBAR bit assignments are:

***When programmed with a vector base address:***

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

**Reserved, bits [4:0]**

Reserved, see Configurations.

## Accessing the MVBAR:

To access the MVBAR:

```
MRC p15,0,<Rt>,c12,c0,1 ; Read MVBAR into Rt
MCR p15,0,<Rt>,c12,c0,1 ; Write Rt to MVBAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1100 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.105 MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RO | Config-RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | Config-RO | Config-RO |

Must be interpreted with MVFR1 and MVFR2.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL2.TFP==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL1 and EL2 read accesses to this register are trapped to EL3.

If HCPTR.TCP10==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPACR.cp10==00, PL1 read accesses to this register are UNDEFINED.

If HCPTR.TCP10==1, Non-secure EL2 read accesses to this register are UNDEFINED.

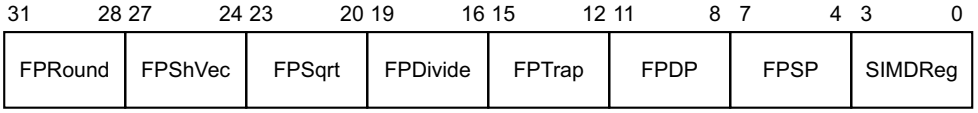
If NSACR.cp10==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR0 is architecturally mapped to AArch64 System register MVFR0_EL1.

Implemented only if the implementation includes floating-point and Advanced SIMD instructions.



**Attributes**

MVFR0 is a 32-bit register.

#### Field descriptions

The MVFR0 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates the rounding modes supported by the VFP floating-point hardware. Defined values are:

`0000` Only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.

`0001` All rounding modes supported.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**FPShVec, bits [27:24]**

Short Vectors. Indicates that the floating-point instructions support the use of short vectors. Defined values are:

`0000` Short vectors not supported.

`0001` Short vector operation supported.

All other values are reserved.

In ARMv8-A the only permitted value is `0000`.

**FPSqrt, bits [23:20]**

Square Root. Indicates the hardware support for the ARMv6 VFP square root operations. Defined values are:

`0000` Not supported in hardware.

`0001` Supported.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

**FPDivide, bits [19:16]**

Indicates the hardware support for VFP divide operations. Defined values are:

`0000` Not supported in hardware.

`0001` Supported.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

**FPTrap, bits [15:12]**

Floating Point Exception Trapping. Indicates whether the VFP hardware implementation supports exception trapping. Defined values are:

`0000` Not supported.

`0001` Supported by the hardware. When exception trapping is supported, support code is needed to handle the trapped exceptions.

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

A value of 0001 does not indicate that trapped exception handling is available. Because trapped exception handling requires support code, only the support code can provide this information.

**FPDP, bits [11:8]**

Double Precision. Indicates the hardware support for VFP double-precision operations. Defined values are:

0000 Not supported in hardware.

0001 Supported, VFPv2.

0010 Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0001.
- VDIV.F64 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

**FPSP, bits [7:4]**

Single Precision. Indicates the hardware support for VFP single-precision operations. Defined values are:

0000 Not supported in hardware.

0001 Supported, VFPv2.

0010 Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0001.
- VDIV.F32 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

**SIMDReg, bits [3:0]**

Advanced SIMD registers. Indicates support for the Advanced SIMD register bank. Defined values are:

0000 Not supported.

0001 Supported, 16 x 64-bit registers.

0010 Supported, 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

If this field is nonzero:

- All VFP LDC, STC, MCR, and MRC instructions are supported.
- If the MCRR and MRRC instructions are supported then the corresponding VFP instructions are supported.

### G6.2.106 MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RO | Config-RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | Config-RO | Config-RO |

Must be interpreted with MVFR0 and MVFR2.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL2.TFP==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL1 and EL2 read accesses to this register are trapped to EL3.

If HCPTR.TCP10==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPACR.cp10==00, PL1 read accesses to this register are UNDEFINED.

If HCPTR.TCP10==1, Non-secure EL2 read accesses to this register are UNDEFINED.

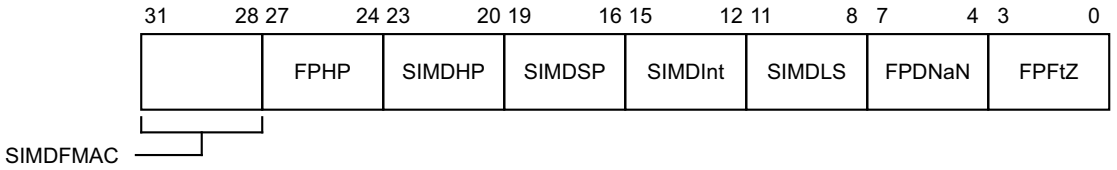
If NSACR.cp10==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR1 is architecturally mapped to AArch64 System register MVFR1_EL1.

Implemented only if the implementation includes floating-point and Advanced SIMD instructions.



**Attributes**

MVFR1 is a 32-bit register.

#### Field descriptions

The MVFR1 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SIMDFMAC, bits [31:28]**

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the floating-point and Advanced SIMD implementation includes the fused multiply accumulate instructions. Defined values are:

`0000` Not implemented.

`0001` Implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

The floating-point and Advanced SIMD implementations must provide the same level of support for these instructions.

**FPHP, bits [27:24]**

Floating Point Half Precision. Indicates whether the floating-point implementation provides half-precision floating-point conversion instructions. Defined values are:

`0000` Not implemented.

`0001` Instructions to convert between half-precision and single-precision implemented.

`0010` As for `0b0001`, and also instructions to convert between half-precision and double-precision implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0010`.

**SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates whether the floating-point and Advanced SIMD implementation provides half-precision floating-point conversion instructions. Defined values are:

`0000` Not implemented.

`0001` Implemented. This value is permitted only if the SIMDSP field is `0001`.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the floating-point and Advanced SIMD implementation provides single-precision floating-point instructions. Defined values are:

`0000` Not implemented.

`0001` Implemented. This value is permitted only if the SIMDInt field is `0001`.

All other values are reserved.

In ARMv8-A the only permitted value is `0001`.

**SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the floating-point and Advanced SIMD implementation provides integer instructions. Defined values are:

`0000` Not implemented.

`0001` Implemented.

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In ARMv8-A the only permitted value is 0001.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the floating-point and Advanced SIMD implementation provides load/store instructions. Defined values are:

0000 Not implemented.

0001 Implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the VFP hardware implementation supports only the Default NaN mode. Defined values are:

0000 Hardware supports only the Default NaN mode.

0001 Hardware supports propagation of NaN values.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the VFP hardware implementation supports only the Flush-to-Zero mode of operation. Defined values are:

0000 Hardware supports only the Flush-to-Zero mode of operation.

0001 Hardware supports full denormalized number arithmetic.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the MVFR1:

To access the MVFR1:

```
VMRS <Rt>, MVFR1 ; Read MVFR1 into Rt
```

Register access is encoded as follows:

### G6.2.107 MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RO | Config-RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | Config-RO | Config-RO |

Must be interpreted with MVFR0 and MVFR1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CPTR_EL2.TFP==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, EL1 and EL2 read accesses to this register are trapped to EL3.

If HCPTR.TCP10==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR.TID3==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If CPACR.cp10==00, PL1 read accesses to this register are UNDEFINED.

If HCPTR.TCP10==1, Non-secure EL2 read accesses to this register are UNDEFINED.

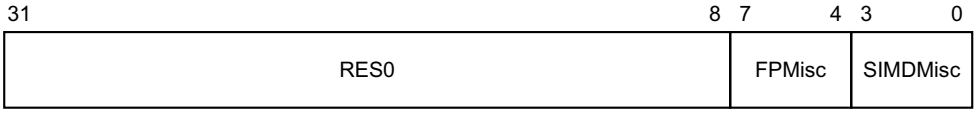
If NSACR.cp10==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR2 is architecturally mapped to AArch64 System register MVFR2_EL1.

Implemented only if the implementation includes floating-point and Advanced SIMD instructions.



**Attributes**

MVFR2 is a 32-bit register.

#### Field descriptions

The MVFR2 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RES0.

**FPMisc, bits [7:4]**

Indicates support for miscellaneous VFP features.

`0000` No support for miscellaneous features.

`0001` Support for Floating-point selection.

`0010` As `0001`, and Floating-point Conversion to Integer with Directed Rounding modes.

`0011` As `0010`, and Floating-point Round to Integral Floating-point.

`0100` As `0011`, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the only permitted value is `0100`.

**SIMDMisc, bits [3:0]**

Indicates support for miscellaneous Advanced SIMD features.

`0000` No support for miscellaneous features.

`0001` Floating-point Conversion to Integer with Directed Rounding modes.

`0010` As `0001`, and Floating-point Round to Integral Floating-point.

`0011` As `0010`, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the only permitted value is `0011`.

### Accessing the MVFR2:

To access the MVFR2:

```
VMRS <Rt>, MVFR2 ; Read MVFR2 into Rt
```

## G6.2.108 NMRR, Normal Memory Remap Register

The NMRR characteristics are:

**Purpose**

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the PRRR.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

NMRR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

NMRR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

NMRR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

Used in conjunction with the PRRR.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Configurations**

AArch32 System register NMRR is architecturally mapped to AArch64 System register MAIR_EL1[63:32].

MAIR1 and NMRR are the same register.

When EL3 is using AArch32, write access to NMRR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

NMRR is a 32-bit register.

## Field descriptions

The NMRR bit assignments are:

***When TTBCR.EAE==0:***

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OR7 | | | | OR6 | | | | OR5 | | | | OR4 | | | | OR3 | | | | OR2 | | | | OR1 | | | | OR0 | | | |
| IR7 | | | | IR6 | | | | IR5 | | | | IR4 | | | | IR3 | | | | IR2 | | | | IR1 | | | | IR0 | | | |

**OR<n>, bits [2n+17:2n+16], for n = 0 to 7**

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

`00` Region is Non-cacheable.

`01` Region is Write-Back, Write-Allocate.

`10` Region is Write-Through, no Write-Allocate.

`11` Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

**IR<n>, bits [2n+1:2n], for n = 0 to 7**

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

`00` Region is Non-cacheable.

`01` Region is Write-Back, Write-Allocate.

`10` Region is Write-Through, no Write-Allocate.

`11` Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

## Accessing the NMRR:

To access the NMRR when TTBCR.EAE==0:

```
MRC p15,0,<Rt>,c10,c2,1 ; Read NMRR into Rt
MCR p15,0,<Rt>,c10,c2,1 ; Write Rt to NMRR
```

Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1010 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.109 NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

**Purpose**

Defines the Non-secure access permissions to Trace, floating-point and Advanced SIMD functionality. Also includes additional IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 (NS) | EL2 (NS) |
|---|---|---|
| - | RO | RO |

For information about the behavior of accesses to the NSACR when EL3 is not implemented or is using AArch64, see Configurations.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

If EL3 is not implemented, then any read of the NSACR from EL2 using AArch32 or from EL1 using AArch32 returns a value of `0x00000C00`.

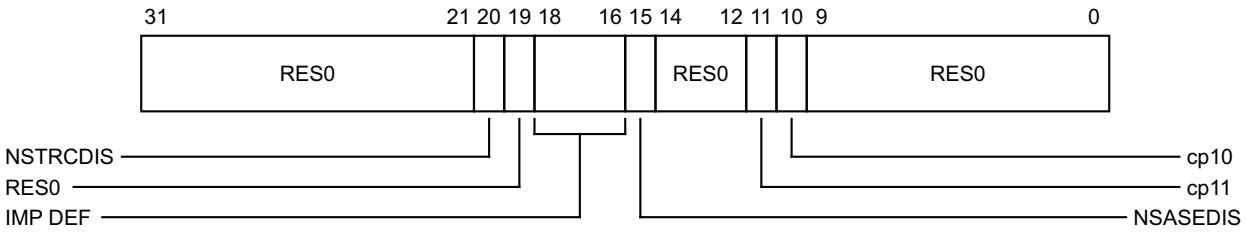
If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 using AArch32 or Non-secure EL1 using AArch32 returns a value of `0x00000C00`.
- Any read or write to NSACR from Secure EL1 using AArch32 is trapped as an exception to EL3.

**Note**

In AArch64, the NSACR functionality is replaced by functionality in CPTR_EL3.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.



**Attributes**

NSACR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The NSACR bit assignments are:

**Bits [31:21]**

Reserved, RES0.

**NSTRCDIS, bit [20]**

Disables Non-secure System register accesses to all implemented trace registers.

`0` This control has no effect on:

- System register access to implemented trace registers.
- The behavior of CPACR.TRCDIS and HCPTR.TTA.

`1` Non-secure System register accesses to all implemented trace registers are disabled, meaning:

- CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.
- HCPTR.TTA behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.TRCDIS field:

- If CPACR.TRCDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.TRCDIS is RW, this field is RW.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bit [19]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [18:16]**

IMPLEMENTATION DEFINED.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**NSASEDIS, bit [15]**

Disables Non-secure access to the Advanced SIMD functionality.

`0` This control has no effect on:

- Non-secure access to Advanced SIMD functionality.
- The behavior of CPACR.ASEDIS and HCPTR.TASE.

`1` Non-secure access to the Advanced SIMD functionality is disabled, meaning:

- CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.
- HCPTR.TASE behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.ASEDIS field:

- If CPACR.ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If CPACR.ASEDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.ASEDIS is RW, this field is RW.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**Bits [14:12]**

Reserved, RES0.

**cp11, bit [11]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to an architecturally UNKNOWN value.

**cp10, bit [10]**

Enable Non-secure access to the floating-point and Advanced SIMD features. Possible values of the fields are:

`0` Floating-point and Advanced SIMD features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. If the PE is in Non-secure state, the CPACR.{cp11, cp10} fields ignore writes and read as `0b00`, access denied.

`1` Floating-point and Advanced SIMD features can be accessed from both Security states.

If Non-secure access to the floating-point and Advanced SIMD functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to an architecturally UNKNOWN value.

**Bits [9:0]**

Reserved, RES0.

Non-Confidential - Beta

### Accessing the NSACR:

To access the NSACR:

```
MRC p15,0,<Rt>,c1,c1,2 ; Read NSACR into Rt
MCR p15,0,<Rt>,c1,c1,2 ; Write Rt to NSACR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0001 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.110 PAR, Physical Address Register

The PAR characteristics are:

**Purpose**

Returns the output address (OA) from an address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

PAR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

PAR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

PAR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies:
  - For a result returned to a 32-bit PAR, to the NOS, SH, Inner, and Outer fields.
  - For a result returned to a 64-bit PAR, to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T7==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T7==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register PAR is architecturally mapped to AArch64 System register PAR_EL1.

The PAR returns a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- When the PE is in Hyp mode for the ATS12NSOxx instructions when the value of HCR.VM is 0 and the value of TTBCR.EAE is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR returns a 64-bit value. This means it returns a 64-bit value in the following cases:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and TTBCR.EAE is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, TTBCR.EAE selects the translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

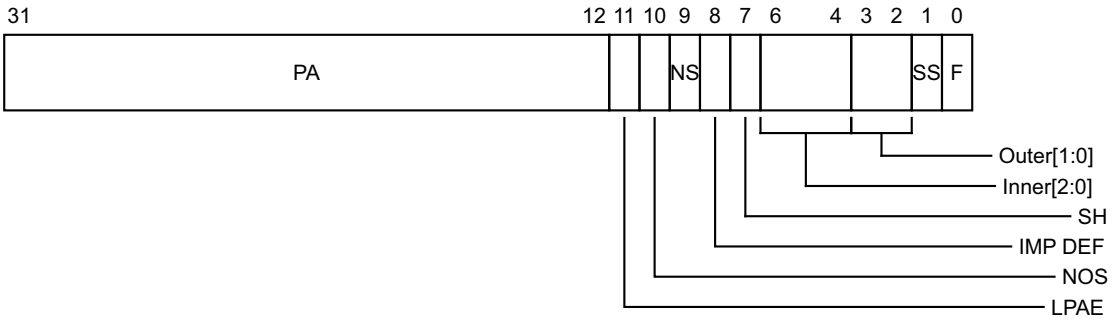
PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

## Field descriptions

The PAR bit assignments are:

***For all register layouts:***



**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

`0` Address translation completed successfully.

`1` Address translation aborted.

***When the instruction returned a 32-bit value to the PAR, PAR.F==0:***

This section describes the register value returned by the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**PA, bits [31:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

`0` Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**NOS, bit [10]**

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

0 Memory region is Outer Shareable.

1 Memory region is Inner Shareable.

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

See the Usage constraints for more information about the value returned.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

**IMP DEF, bit [8]**

IMPLEMENTATION DEFINED.

**SH, bit [7]**

Shareability. Indicates whether the physical memory region is Non-shareable:

0 Memory is Non-shareable.

1 Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.

See the Usage constraints for more information about the value returned.

**Inner[2:0], bits [6:4]**

Inner cacheability attribute for the region. Permitted values are:

000 Non-cacheable.

001 Device-nGnRnE.

011 Device-nGnRE.

101 Write-Back, Write-Allocate.

110 Write-Through.

111 Write-Back, no Write-Allocate.

The values 010 and 100 are reserved.

See the Usage constraints for more information about the value returned.

**Outer[1:0], bits [3:2]**

Outer cacheability attribute for the region. Permitted values are:

00 Non-cacheable.

01 Write-Back, Write-Allocate.

10 Write-Through, no Write-Allocate.

11 Write-Back, no Write-Allocate.

See the Usage constraints for more information about the value returned.

**SS, bit [1]**

Supersection. Used to indicate if the result is a Supersection:

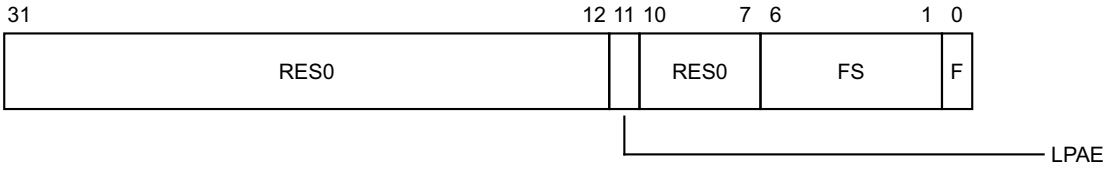
0 Result is not a Supersection. PAR[31:12] contains OA[31:12].

1 Result is a Supersection, and:

- PAR[31:24] contains OA[31:24].

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- PAR[23:16] contains OA[39:32].
- PAR[15:12] contains 0b0000.



If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

0 Address translation completed successfully.

***When the instruction returned a 32-bit value to the PAR, PAR.F==1:***

This section describes the register value returned by the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**Bits [31:12]**

Reserved, RES0.

**LPAE, bit [11]**

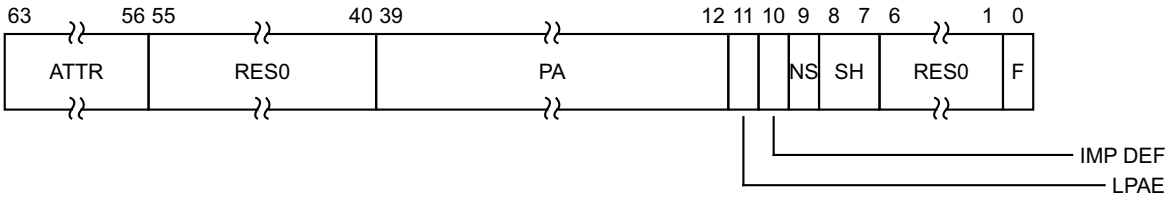
When updating the PAR with the result of the translation operation, this bit is set as follows:

0 Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

**Bits [10:7]**

Reserved, RES0.

**FS, bits [6:1]**



Fault status bits. Bits [12,10,3:0] from the DFSR, indicating the source of the abort.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

1 Address translation aborted.

***When the instruction returned a 64-bit value to the PAR, PAR.F==0:***

This section describes the register value returned by the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

See the Usage constraints for more information about the value returned.

**Bits [55:40]**

Reserved, RES0.

**PA, bits [39:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

`1` Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

**IMP DEF, bit [10]**

IMPLEMENTATION DEFINED.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

`00` Non-shareable.

`10` Outer Shareable.

`11` Inner Shareable.

The value `01` is reserved.

**Note**

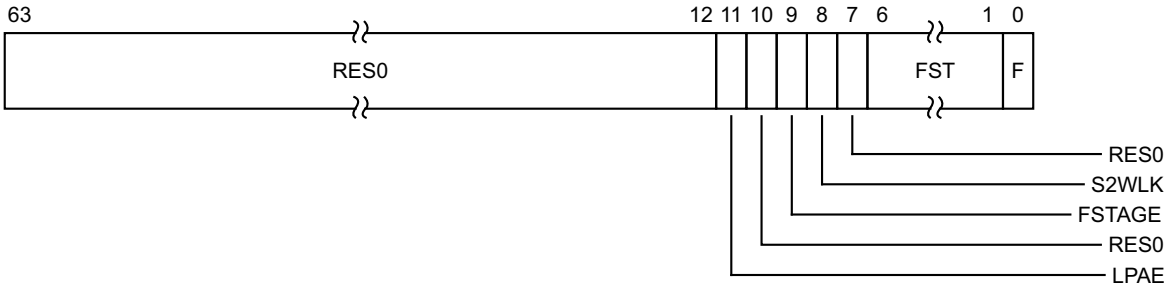
This field returns the value `10` for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

See the Usage constraints for more information about the value returned.

**Bits [6:1]**

Reserved, RES0.



**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

`0` Address translation completed successfully.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

***When the instruction returned a 64-bit value to the PAR, PAR.F==1:***

This section describes the register value returned by the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**Bits [63:12]**

Reserved, RES0.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

1 Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

**Bit [10]**

Reserved, RES0.

**FSTAGE, bit [9]**

Indicates the translation stage at which the translation aborted:

0 Translation aborted because of a fault in the stage 1 translation.

1 Translation aborted because of a fault in the stage 2 translation.

**S2WLK, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

**Bit [7]**

Reserved, RES0.

**FST, bits [6:1]**

Fault status field. Values are as in the DFSR.STATUS and IFSR.STATUS fields when using the Long-descriptor translation table format.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

1 Address translation aborted.

## Accessing the PAR:

To access the PAR when accessing as a 32-bit register:

```
MRC p15,0,<Rt>,c7,c4,0 ; Read PAR[31:0] into Rt
MCR p15,0,<Rt>,c7,c4,0 ; Write Rt to PAR[31:0]. PAR[63:32] are unchanged
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0111 | 0100 | 000 |

To access the PAR when accessing as a 64-bit register:

```
MRRC p15,0,<Rt>,<Rt2>,c7 ; Read PAR[31:0] into Rt and PAR[63:32] into Rt2
MCRR p15,0,<Rt>,<Rt2>,c7 ; Write Rt to PAR[31:0] and Rt2 to PAR[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0000 | 0111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.111 PRRR, Primary Region Remap Register

The PRRR characteristics are:

**Purpose**

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

PRRR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

PRRR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

PRRR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

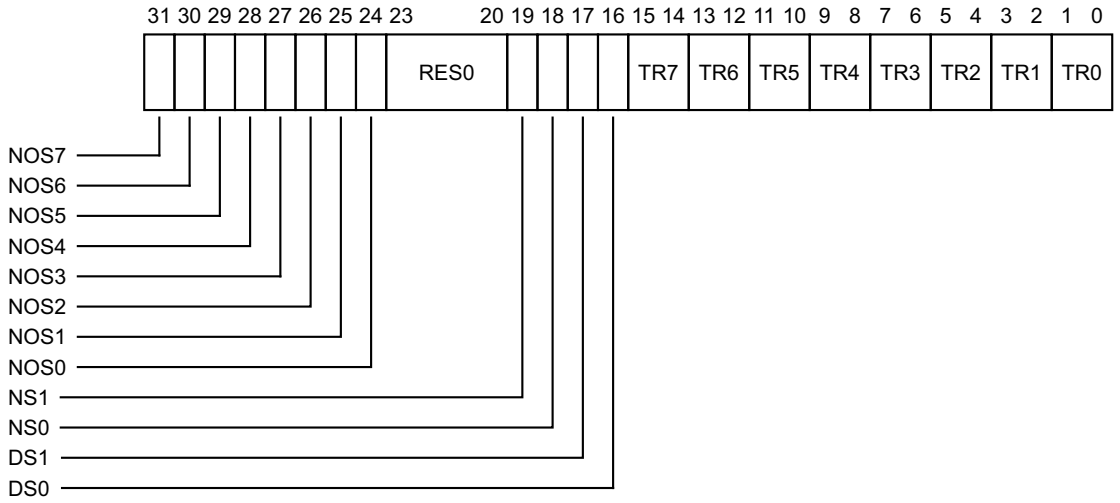
AArch32 System register PRRR is architecturally mapped to AArch64 System register MAIR_EL1[31:0].

MAIR0 and PRRR are the same register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When EL3 is using AArch32, write access to PRRR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PRRR is a 32-bit register.

## Field descriptions

The PRRR bit assignments are:

***When TTBCR.EAE==0:***

**NOS<n>, bit [n+24], for n = 0 to 7**

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

`0` Memory region is Outer Shareable.

`1` Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - — Inner Non-cacheable, Outer Non-cacheable.
  - — Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

**Bits [23:20]**

Reserved, RES0.

**NS1, bit [19]**

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Has the S bit in the translation table descriptor set to 1.

The possible values of this bit are:

0 Region is Non-shareable.

1 Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

**NS0, bit [18]**

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

The possible values of this bit are:

0 Region is Non-shareable.

1 Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

**DS1, bit [17]**

Mapping of S = 1 attribute for Device memory. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

**DS0, bit [16]**

Mapping of S = 0 attribute for Device memory. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

**TR<n>, bits [2n+1:2n], for n = 0 to 7**

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

00 Device-nGnRnE memory

01 Device-nGnRE memory

10 Normal memory

The value 11 is reserved. The effect of programming a field to 11 is CONSTRAINED UNPREDICTABLE, see *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

## Accessing the PRRR:

To access the PRRR when TTBCR.EAE==0:

```
MRC p15,0,<Rt>,c10,c2,0 ; Read PRRR into Rt
MCR p15,0,<Rt>,c10,c2,0 ; Write Rt to PRRR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1010 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.112 REVIDR, Revision ID Register

The REVIDR characteristics are:

**Purpose**

Provides implementation-specific minor revision information.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID1==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID1==1, Non-secure EL1 read accesses to this register are trapped to EL2.

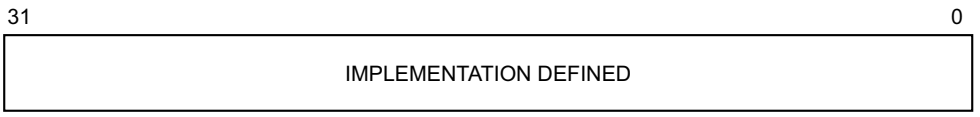
If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register REVIDR is architecturally mapped to AArch64 System register REVIDR_EL1.



If REVIDR has the same value as MIDR, then its contents have no significance.

**Attributes**

REVIDR is a 32-bit register.

#### Field descriptions

The REVIDR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the REVIDR:

To access the REVIDR:

```
MRC p15,0,<Rt>,c0,c0,6 ; Read REVIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0000 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.113 RMR (at EL1), Reset Management Register

The RMR (at EL1) characteristics are:

**Purpose**

If this register's Exception level is the highest implemented Exception level:

- A write to the register can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, specifies the Execution state that the PE boots into on a Warm reset.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 |
|---|---|
| - | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

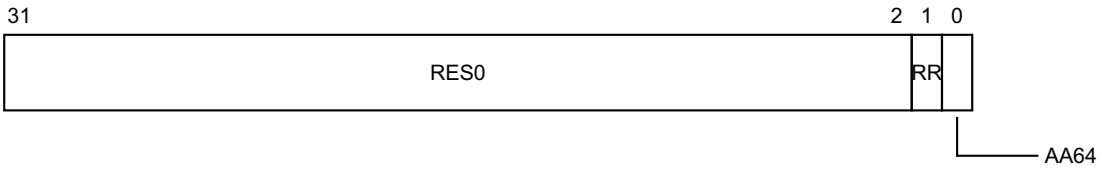
AArch32 System register RMR (at EL1) is architecturally mapped to AArch64 System register RMR_EL1.

Only implemented if this register's Exception level is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

When this register is not implemented its encoding is UNDEFINED at EL1.

See the field descriptions for the reset values. These apply whenever the register is implemented.



**Attributes**

RMR (at EL1) is a 32-bit register.

#### Field descriptions

The RMR (at EL1) bit assignments are:

***When EL2 and EL3 not implemented:***

**Bits [31:2]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to `0`. This reset value applies on a Cold reset and on a Warm reset.

**AA64, bit [0]**

When the highest implemented Exception level can use AArch32, determines which Execution state the PE boots into after a Warm reset:

`0` AArch32.

`1` AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

If this field is implemented as an RW field, this field resets to `0`. This reset value applies on a Cold reset.

This field resets to its defined reset value on Cold reset.

### Accessing the RMR (at EL1):

To access the RMR (at EL1) when EL2 and EL3 not implemented:

```
MRC p15,0,<Rt>,c12,c0,2 ; Read RMR into Rt
MCR p15,0,<Rt>,c12,c0,2 ; Write Rt to RMR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1100 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.114 RMR (at EL3), Reset Management Register

The RMR (at EL3) characteristics are:

**Purpose**

If this register's Exception level is the highest implemented Exception level:

- A write to the register can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, specifies the Execution state that the PE boots into on a Warm reset.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

If EL3 is implemented, the AArch32 view of the RMR register is subject to CP15SDISABLE, which prevents writing to this register when the CP15SDISABLE signal is asserted.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register RMR (at EL3) is architecturally mapped to AArch64 System register RMR_EL3.

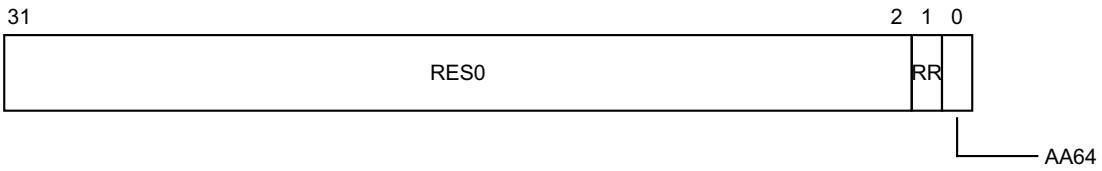
Only implemented if this register's Exception level is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

When this register is not implemented its encoding is UNDEFINED at EL3.

See the field descriptions for the reset values. These apply whenever the register is implemented.

**Attributes**



RMR (at EL3) is a 32-bit register.

#### Field descriptions

The RMR (at EL3) bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

***When EL3 implemented:***

**Bits [31:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to `0`. This reset value applies on a Cold reset and on a Warm reset.

**AA64, bit [0]**

When the highest implemented Exception level can use AArch32, determines which Execution state the PE boots into after a Warm reset:

`0` AArch32.

`1` AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

If this field is implemented as an RW field, this field resets to `0`. This reset value applies on a Cold reset.

## Accessing the RMR (at EL3):

To access the RMR (at EL3) when EL3 implemented:

```
MRC p15,0,<Rt>,c12,c0,2 ; Read RMR into Rt
MCR p15,0,<Rt>,c12,c0,2 ; Write Rt to RMR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1100 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.115 RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

**Purpose**

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

**Usage constraints**

If EL1 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

| EL0 | EL1 |
|---|---|
| - | RO |

If EL2 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RO |

This register can only be read at the highest Exception level implemented. It is UNDEFINED at all other Exception levels.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

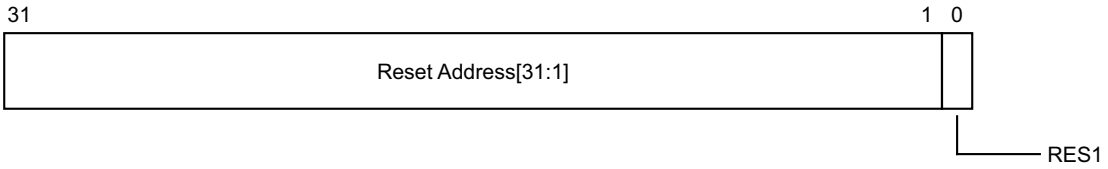
Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

**Attributes**

RVBAR is a 32-bit register.

#### Field descriptions

The RVBAR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:1]**

Reset Address[31:1]. Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

**Bit [0]**

Reserved, RES1.

### Accessing the RVBAR:

To access the RVBAR:

```
MRC p15,0,<Rt>,c12,c0,1 ; Read RVBAR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1100 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.116 SCR, Secure Configuration Register

The SCR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External Abort occurs.
- Whether the CPSR.F or CPSR.A bits can be modified when SCR.NS==1.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|---|
| - | - | - | RW | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

If EL3 is implemented and is using AArch64, any read or write to SCR from Secure EL1 using AArch32 is trapped as an exception to EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

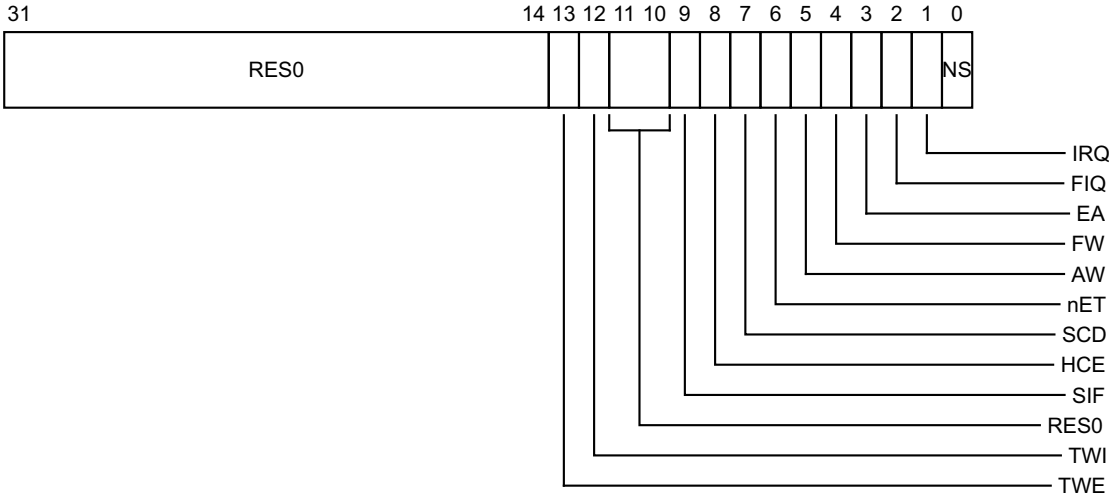
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register SCR can be mapped to AArch64 System register SCR_EL3, but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.



**Attributes**

SCR is a 32-bit register.

#### Field descriptions

The SCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:14]**

Reserved, RES0.

**TWE, bit [13]**

Traps WFE instructions to Monitor mode.

`0` This control has no effect on the execution of WFE instructions.

`1` Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2.

Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TWI, bit [12]**

Traps WFI instructions to Monitor mode.

`0` This control has no effect on the execution of WFI instructions.

`1` Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2.

Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bits [11:10]**

Reserved, RES0.

**SIF, bit [9]**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

`0` Secure state instruction fetches from Non-secure memory are permitted.

`1` Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to `0`.

**HCE, bit [8]**

Hypervisor Call instruction enable. Enables EL2 and Non-secure EL1 execution of HVC instructions.

`0` HVC instructions are:

- UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1.
- UNPREDICTABLE at EL2. Behavior is one of the following:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

`1` HVC instructions are enabled at EL2 and Non-secure EL1.

**Note**

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**SCD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions.

`0` SMC instructions are enabled.

`1` In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level.

In Secure state, behavior is one of the following:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

**Note**

SMC instructions are always UNDEFINED at PL0.

When this register has an architecturally-defined reset value, this field resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**nET, bit [6]**

Not Early Termination. This bit disables early termination. The possible values of this bit are:

`0` Early termination permitted. Execution time of data operations can depend on the data values.

`1` Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**AW, bit [5]**

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether CPSR.A masks an external abort taken from Non-secure state, and the possible values of this bit are:

`0` External aborts taken from Non-secure state are not masked by CPSR.A, and are taken to EL3.

External aborts taken from Secure state are masked by CPSR.A.

`1` External aborts taken from either Security state are masked by CPSR.A. When CPSR.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

When this register has an architecturally-defined reset value, this field resets to `0`.

**FW, bit [4]**

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether CPSR.F masks an FIQ interrupt taken from Non-secure state, and the possible values of this bit are:

`0` An FIQ taken from Non-secure state is not masked by CPSR.F, and is taken to EL3.

An FIQ taken from Secure state is masked by CPSR.F.

`1` An FIQ taken from either Security state is masked by CPSR.F. When CPSR.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

When this register has an architecturally-defined reset value, this field resets to `0`.

**EA, bit [3]**

External Abort handler. This bit controls which mode takes external aborts. The possible values of this bit are:

`0` External aborts taken to Abort mode.

`1` External aborts taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**FIQ, bit [2]**

FIQ handler. This bit controls which mode takes FIQ exceptions. The possible values of this bit are:

`0` FIQs taken to FIQ mode.

`1` FIQs taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to `0`.

**IRQ, bit [1]**

IRQ handler. This bit controls which mode takes IRQ exceptions. The possible values of this bit are:

`0` IRQs taken to IRQ mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 IRQs taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**NS, bit [0]**

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

0 PE is in Secure state.

1 PE is in Non-secure state.

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the SCR:

To access the SCR:

```
MRC p15,0,<Rt>,c1,c1,0 ; Read SCR into Rt
MCR p15,0,<Rt>,c1,c1,0 ; Write Rt to SCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.117 SCTLR, System Control Register

The SCTLR characteristics are:

**Purpose**

Provides the top level control of the system, including its memory system.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

SCTLR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

SCTLR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

SCTLR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

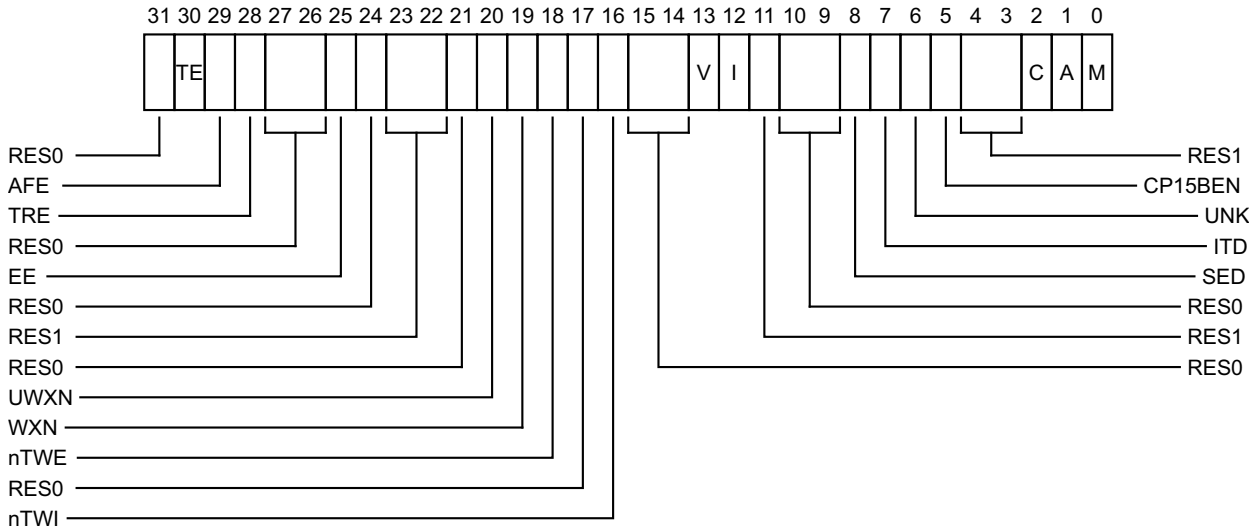
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register SCTLR is architecturally mapped to AArch64 System register SCTLR_EL1.

When EL3 is using AArch32, write access to SCTLR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCTLR is a 32-bit register.

## Field descriptions

The SCTLR bit assignments are:

**Bit [31]**

Reserved, RES0.

**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:

0 Exceptions, including reset, taken to A32 state.

1 Exceptions, including reset, taken to T32 state.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- A value determined by an input configuration signal.

**AFE, bit [29]**

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

0 In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.

1 In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to `0`.

**TRE, bit [28]**

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

`0` TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.

`1` TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of TTBCR.EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bits [27:26]**

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

`0` Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.

`1` Big-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to an IMPLEMENTATION DEFINED choice between:

- `0`.
- A value determined by an input configuration signal.

**Bit [24]**

Reserved, RES0.

**Bits [23:22]**

Reserved, RES1.

**Bit [21]**

Reserved, RES0.

**UWXN, bit [20]**

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writeable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

`0` This control has no effect on memory access permissions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Any region that is writeable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writeable to be treated as XN. The possible values of this bit are:

0 This control has no effect on memory access permissions.

1 Any region that is writeable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

The WXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

**nTWE, bit [18]**

Traps PL0 execution of WFE instructions to Undefined mode.

0 Any attempt to execute a WFE instruction at PL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

1 This control has no effect on the PL0 execution of WFE instructions.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 1.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps PL0 execution of WFI instructions to Undefined mode.

0 Any attempt to execute a WFI instruction at PL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

1 This control has no effect on the PL0 execution of WFI instructions.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 1.

**Bits [15:14]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**V, bit [13]**

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

`0` Normal exception vectors. Base address is held in VBAR.

`1` High exception vectors (Hivecs), base address `0xFFFF0000`. This base address cannot be remapped.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED choice between:

- `0`.
- A value determined by an input configuration signal.

**I, bit [12]**

Instruction cache enable. This is a global enable bit for instruction caches:

`0` All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

`1` All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache.

If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from Non-secure EL1 and Non-secure EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bit [11]**

Reserved, RES1.

**Bits [10:9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

`0` SETEND instruction execution is enabled at PL0 and PL1.

`1` SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

`0` All IT instruction functionality is enabled at PL1 and PL0.

`1` Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0]!=1000.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- All encodings of the subsequent instruction with the following values for hw1:

  `11xxxxxxxxxxxxx`
  : All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.

  `1011xxxxxxxxxxx`
  : All instructions in *Miscellaneous 16-bit instructions* on page F3-2471.

  `10100xxxxxxxxxx`
  : ADD Rd, PC, #imm

  `01001xxxxxxxxxx`
  : LDR Rd, [PC, #imm]

  `0100x1xxx1111xxx`
  : ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.

  `010001xx1xxxx111`
  : ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

  These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

  It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

  - A 16-bit instruction, that can only be followed by another 16-bit instruction.
  - The first half of a 32-bit instruction.

  This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

  An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `0`.

**UNK, bit [6]**

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

**CP15BEN, bit [5]**

CP15 memory barrier enable. Enables accesses to the CP15 DMB, DSB, and ISB barrier operations from PL1 and PL0:

`0` PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.

`1` PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to `1`.

**Bits [4:3]**

Reserved, RES1.

**C, bit [2]**

Cache enable, for data caching.

`0` All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCLTR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

0 Alignment fault checking disabled when executing at PL1 or PL0.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

1 Alignment fault checking enabled when executing at PL1 or PL0.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When this register has an architecturally-defined reset value, this field resets to 0.

**M, bit [0]**

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

0 EL1 and EL0 stage 1 address translation disabled.

See the SCTLR.I field for the behavior of instruction accesses to Normal memory.

1 EL1 and EL0 stage 1 address translation enabled.

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the SCTLR:

To access the SCTLR:

```
MRC p15,0,<Rt>,c1,c0,0 ; Read SCTLR into Rt
MCR p15,0,<Rt>,c1,c0,0 ; Write Rt to SCTLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.118 SPSR, Saved Program Status Register

The SPSR characteristics are:

**Purpose**

Holds the saved process state for the current mode.

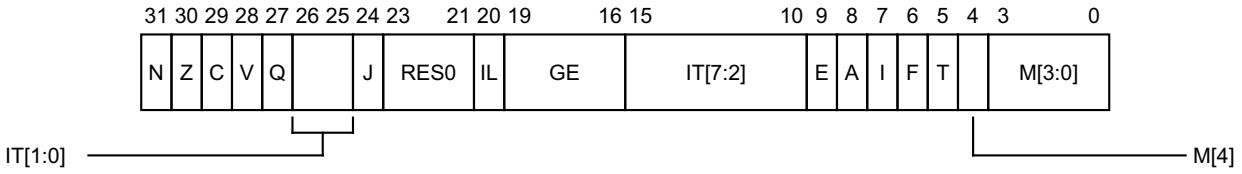
**Usage constraints**

The SPSR can be read using the MRS instruction and written using the MSR (immediate) or MSR (register) instructions. For more details on the instruction syntax, see *PSTATE and banked register access instructions* on page F1-2420.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

SPSR is a 32-bit register.

### Field descriptions

The SPSR bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to the current mode, and copied to CPSR.N on executing an exception return operation in the current mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to the current mode, and copied to CPSR.Z on executing an exception return operation in the current mode.

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to the current mode, and copied to CPSR.C on executing an exception return operation in the current mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to the current mode, and copied to CPSR.V on executing an exception return operation in the current mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to the current mode, and copied to CPSR.Q on executing an exception return operation in the current mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

`0` Taken from A32 state.

`1` Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

`1` Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| `0b0000` | User |
| `0b0001` | FIQ |
| `0b0010` | IRQ |
| `0b0011` | Supervisor |
| `0b0110` | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| `0b0111` | Abort |
| `0b1010` | Hyp |
| `0b1011` | Undefined |
| `0b1111` | System |

Other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.119 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS, !ABT) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

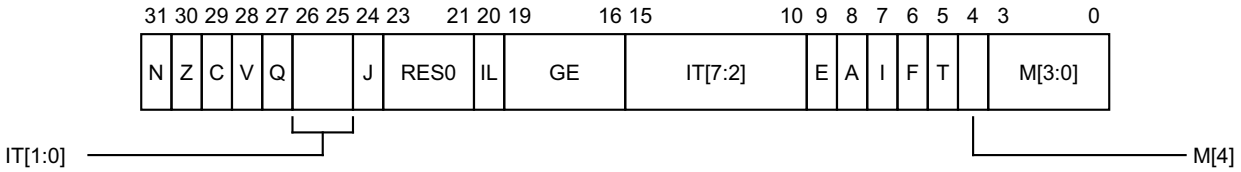
This register is only accessible at EL1 in modes other than Abort mode. In Abort mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register SPSR_abt is architecturally mapped to AArch64 System register SPSR_abt.

**Attributes**

SPSR_abt is a 32-bit register.

## Field descriptions

The SPSR_abt bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Abort mode, and copied to CPSR.N on executing an exception return operation in Abort mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Abort mode, and copied to CPSR.Z on executing an exception return operation in Abort mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Abort mode, and copied to CPSR.C on executing an exception return operation in Abort mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Abort mode, and copied to CPSR.V on executing an exception return operation in Abort mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to Abort mode, and copied to CPSR.Q on executing an exception return operation in Abort mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| 0b0111 | Abort |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

## Accessing the SPSR_abt:

To access the SPSR_abt:

```
MRS <Rd>, SPSR_abt ; Read SPSR_abt into Rd
MSR SPSR_abt, <Rd> ; Write Rd to SPSR_abt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| m | m1 | R |
|---|---|---|
| 1 | 0100 | 1 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.120 SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS, !FIQ) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

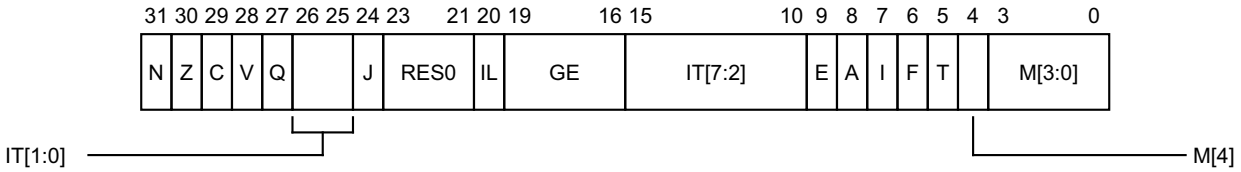
This register is only accessible at EL1 in modes other than FIQ mode. In FIQ mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register SPSR_fiq is architecturally mapped to AArch64 System register SPSR_fiq.

**Attributes**

SPSR_fiq is a 32-bit register.

### Field descriptions

The SPSR_fiq bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to FIQ mode, and copied to CPSR.N on executing an exception return operation in FIQ mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to FIQ mode, and copied to CPSR.Z on executing an exception return operation in FIQ mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to FIQ mode, and copied to CPSR.C on executing an exception return operation in FIQ mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to FIQ mode, and copied to CPSR.V on executing an exception return operation in FIQ mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to FIQ mode, and copied to CPSR.Q on executing an exception return operation in FIQ mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| 0b0111 | Abort |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

## Accessing the SPSR_fiq:

To access the SPSR_fiq:

```
MRS <Rd>, SPSR_fiq ; Read SPSR_fiq into Rd
MSR SPSR_fiq, <Rd> ; Write Rd to SPSR_fiq
```

### G6.2.121 SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

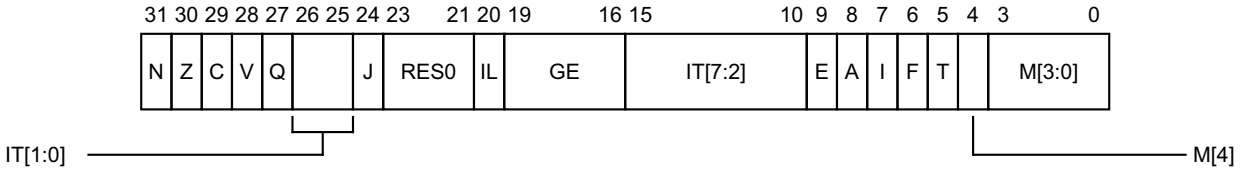
In Hyp mode, this register is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register SPSR_hyp is architecturally mapped to AArch64 System register SPSR_EL2.

**Attributes**

SPSR_hyp is a 32-bit register.

## Field descriptions

The SPSR_hyp bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Hyp mode, and copied to CPSR.N on executing an exception return operation in Hyp mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Hyp mode, and copied to CPSR.Z on executing an exception return operation in Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Hyp mode, and copied to CPSR.C on executing an exception return operation in Hyp mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Hyp mode, and copied to CPSR.V on executing an exception return operation in Hyp mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to Hyp mode, and copied to CPSR.Q on executing an exception return operation in Hyp mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

## Accessing the SPSR_hyp:

To access the SPSR_hyp:

## G6.2.122 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS, !IRQ) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

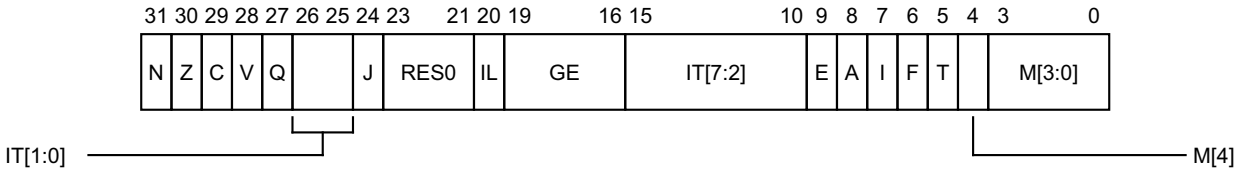
This register is only accessible at EL1 in modes other than IRQ mode. In IRQ mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register SPSR_irq is architecturally mapped to AArch64 System register SPSR_irq.

**Attributes**

SPSR_irq is a 32-bit register.

### Field descriptions

The SPSR_irq bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to IRQ mode, and copied to CPSR.N on executing an exception return operation in IRQ mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to IRQ mode, and copied to CPSR.Z on executing an exception return operation in IRQ mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to IRQ mode, and copied to CPSR.C on executing an exception return operation in IRQ mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to IRQ mode, and copied to CPSR.V on executing an exception return operation in IRQ mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to IRQ mode, and copied to CPSR.Q on executing an exception return operation in IRQ mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| 0b0111 | Abort |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

### G6.2.123 SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Monitor mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1, !Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

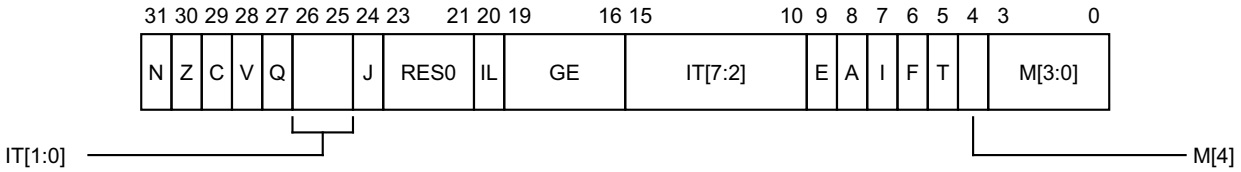
This register is only accessible at EL3 in modes other than Monitor mode. In Monitor mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

This register is only accessible in Secure state.



AArch32 System register SPSR_mon can be mapped to AArch64 System register SPSR_EL3, but this is not architecturally mandated.

**Attributes**

SPSR_mon is a 32-bit register.

## Field descriptions

The SPSR_mon bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Monitor mode, and copied to CPSR.N on executing an exception return operation in Monitor mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Monitor mode, and copied to CPSR.Z on executing an exception return operation in Monitor mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Monitor mode, and copied to CPSR.C on executing an exception return operation in Monitor mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Monitor mode, and copied to CPSR.V on executing an exception return operation in Monitor mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to Monitor mode, and copied to CPSR.Q on executing an exception return operation in Monitor mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

### G6.2.124 SPSR_svc, Saved Program Status Register (Sup. Call mode)

The SPSR_svc characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Supervisor mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS, !SVC) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

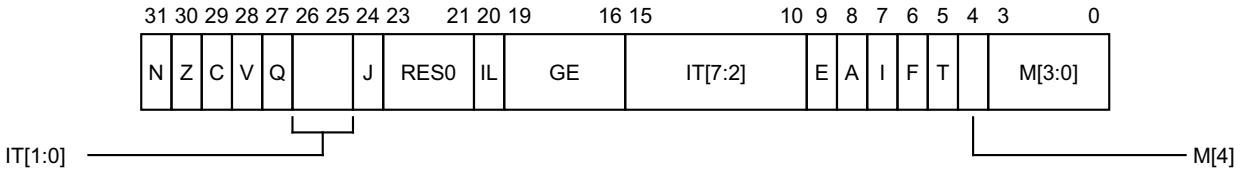
This register is only accessible at EL1 in modes other than Supervisor mode. In Supervisor mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register SPSR_svc is architecturally mapped to AArch64 System register SPSR_EL1.

**Attributes**

SPSR_svc is a 32-bit register.

## Field descriptions

The SPSR_svc bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Supervisor mode, and copied to CPSR.N on executing an exception return operation in Supervisor mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Supervisor mode, and copied to CPSR.Z on executing an exception return operation in Supervisor mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Supervisor mode, and copied to CPSR.C on executing an exception return operation in Supervisor mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Supervisor mode, and copied to CPSR.V on executing an exception return operation in Supervisor mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to Supervisor mode, and copied to CPSR.Q on executing an exception return operation in Supervisor mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

Non-Confidential - Beta

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| 0b0111 | Abort |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

### Accessing the SPSR_svc:

## G6.2.125 SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS, !UND) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

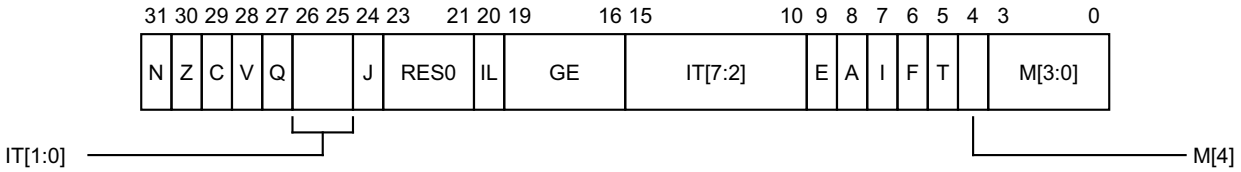
This register is only accessible at EL1 in modes other than Undefined mode. In Undefined mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register SPSR_und is architecturally mapped to AArch64 System register SPSR_und.

**Attributes**

SPSR_und is a 32-bit register.

### Field descriptions

The SPSR_und bit assignments are:

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Undefined mode, and copied to CPSR.N on executing an exception return operation in Undefined mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Undefined mode, and copied to CPSR.Z on executing an exception return operation in Undefined mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on taking an exception to Undefined mode, and copied to CPSR.C on executing an exception return operation in Undefined mode.

**V, bit [28]**

Set to the value of CPSR.V on taking an exception to Undefined mode, and copied to CPSR.V on executing an exception return operation in Undefined mode.

**Q, bit [27]**

Set to the value of CPSR.Q on taking an exception to Undefined mode, and copied to CPSR.Q on executing an exception return operation in Undefined mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:21]**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| 0b0111 | Abort |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

### Accessing the SPSR_und:

To access the SPSR_und:

```
MRS <Rd>, SPSR_und ; Read SPSR_und into Rd
MSR SPSR_und, <Rd> ; Write Rd to SPSR_und
```

## G6.2.126 TCMTR, TCM Type Register

The TCMTR characteristics are:

**Purpose**

Provides information about the implementation of the TCM.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TID1==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID1==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

TCMTR is a 32-bit register.

### Field descriptions

The TCMTR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

### Accessing the TCMTR:

To access the TCMTR:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p15,0,<Rt>,c0,c0,2 ; Read TCMTR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.127 TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

**Purpose**

Invalidate all TLB entries for the PL1&0 translation regime, subject to the Privilege level and Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIALL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALL is a 32-bit system operation.

#### Field descriptions

The TLBIALL operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBIALL operation:

To perform the TLBIALL operation:

```
MCR p15,0,<Rt>,c8,c7,0 ; TLBIALL operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0111 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.128 TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

**Purpose**

Invalidate all TLB entries for the PL2 translation regime.

For details of the scope of this instruction see TLBIALLH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLH is a 32-bit system operation.

#### Field descriptions

The TLBIALLH operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBIALLH operation:

To perform the TLBIALLH operation:

```
MCR p15,4,<Rt>,c8,c7,0 ; TLBIALLH operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0111 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.129 TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

**Purpose**

Invalidate all TLB entries for the PL2 translation regime, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIALLH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLHIS is a 32-bit system operation.

#### Field descriptions

The TLBIALLHIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBIALLHIS operation:

To perform the TLBIALLHIS operation:

```
MCR p15,4,<Rt>,c8,c3,0 ; TLBIALLHIS operation, ignoring the value in Rt
```

### G6.2.130 TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

**Purpose**

Invalidate all TLB entries for the PL1&0 translation regime, on all PEs in the same Inner Shareable domain, subject to the Privilege level and Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIALL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLIS is a 32-bit system operation.

#### Field descriptions

The TLBIALLIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBIALLIS operation:

To perform the TLBIALLIS operation:

```
MCR p15,0,<Rt>,c8,c3,0 ; TLBIALLIS operation, ignoring the value in Rt
```

### G6.2.131 TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

**Purpose**

Invalidate all TLB entries for the Non-secure PL1&0 translation regime.

For details of the scope of this instruction see TLBIALLNSNH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLNSNH is a 32-bit system operation.

#### Field descriptions

The TLBIALLNSNH operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBIALLNSNH operation:

To perform the TLBIALLNSNH operation:

```
MCR p15,4,<Rt>,c8,c7,4 ; TLBIALLNSNH operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0111 | 100 |

### G6.2.132 TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

**Purpose**

Invalidate all TLB entries for the Non-secure PL1&0 translation regime, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIALLNSNH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLNSNHIS is a 32-bit system operation.

#### Field descriptions

The TLBIALLNSNHIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

#### Performing the TLBIALLNSNHIS operation:

To perform the TLBIALLNSNHIS operation:

```
MCR p15,4,<Rt>,c8,c3,4 ; TLBIALLNSNHIS operation, ignoring the value in Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.2.133 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIASID.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

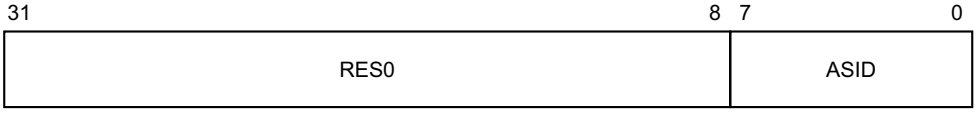
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIASID is a 32-bit system operation.

#### Field descriptions

The TLBIASID input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Performing the TLBIASID operation:

To perform the TLBIASID operation:

```
MCR p15,0,<Rt>,c8,c7,2 ; TLBIASID operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0111 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.134 TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIASID.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

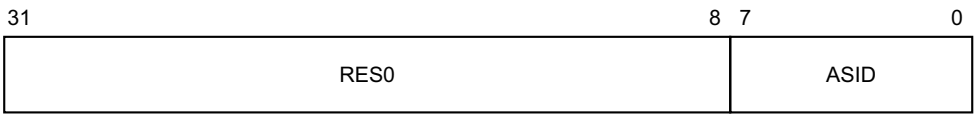
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIASIDIS is a 32-bit system operation.

#### Field descriptions

The TLBIASIDIS input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Performing the TLBIASIDIS operation:

To perform the TLBIASIDIS operation:

```
MCR p15,0,<Rt>,c8,c3,2 ; TLBIASIDIS operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0011 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.135 TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime that match the given IPA and the current VMID.

For details of the scope of this instruction see TLBIIPAS2.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

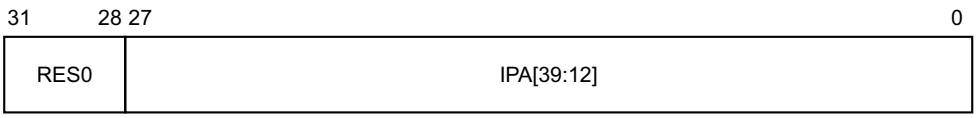
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2 is a 32-bit system operation.

## Field descriptions

The TLBIIPAS2 input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:28]**

Reserved, RES0.

**IPA[39:12], bits [27:0]**

Bits[39:12] of the intermediate physical address to match.

### Performing the TLBIIPAS2 operation:

To perform the TLBIIPAS2 operation:

```
MCR p15,4,<Rt>,c8,c4,1 ; TLBIIPAS2 operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0100 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.136 TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime that match the given IPA and the current VMID, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIIPAS2.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

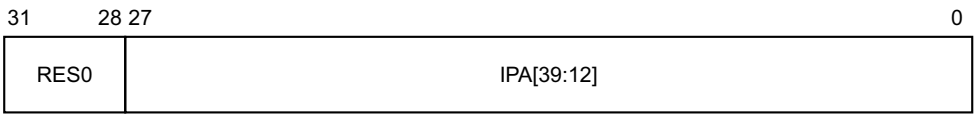
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2IS is a 32-bit system operation.

## Field descriptions

The TLBIIPAS2IS input value bit assignments are:

### G6.2.137 TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime, for the last level of translation, that match the given IPA and the current VMID.

For details of the scope of this instruction see TLBIIPAS2.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

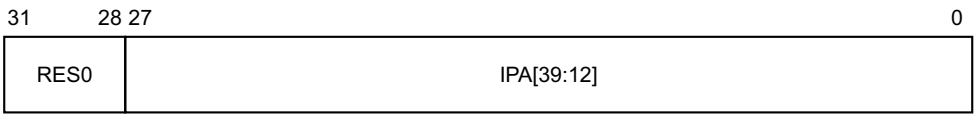
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2L is a 32-bit system operation.

## Field descriptions

### G6.2.138 TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

The TLBIIPAS2LIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime, for the last level of translation, that match the given IPA and the current VMID, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIIPAS2L.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

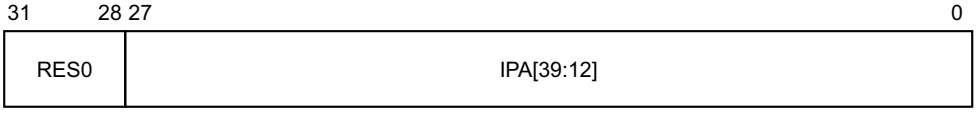
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2LIS is a 32-bit system operation.

## Field descriptions

The TLBIIPAS2LIS input value bit assignments are:

### G6.2.139 TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

**Purpose**

Invalidate PL1&0 regime stage 1 and 2 TLB entries for the given VA and ASID, the current VMID, and the current Security state.

For details of the scope of this instruction see TLBIMVA.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

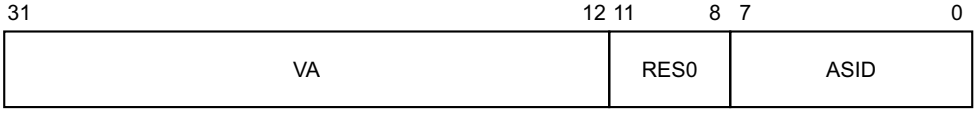
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIMVA is a 32-bit system operation.

#### Field descriptions

The TLBIMVA input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Performing the TLBIMVA operation:

To perform the TLBIMVA operation:

```
MCR p15,0,<Rt>,c8,c7,1 ; TLBIMVA operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0111 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.140 TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for any ASID, that match the given VA, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAA.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

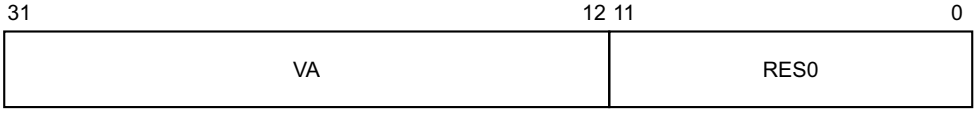
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIMVAA is a 32-bit system operation.

#### Field descriptions

### G6.2.141 TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for any ASID, that match the given VA, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAA.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

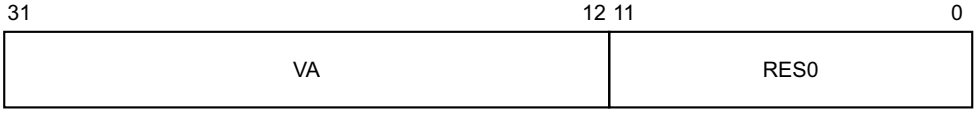
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIMVAAIS is a 32-bit system operation.

#### Field descriptions

The TLBIMVAAIS input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

**Bits [11:0]**

Reserved, RES0.

### Performing the TLBIMVAAIS operation:

To perform the TLBIMVAAIS operation:

```
MCR p15,0,<Rt>,c8,c3,3 ; TLBIMVAAIS operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |

### G6.2.142 TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for the last level of translation, for any ASID, that match the given VA, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAAL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

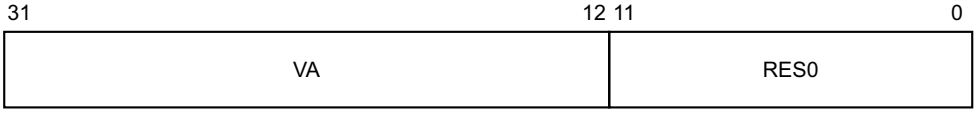
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVAAL is a 32-bit system operation.

#### Field descriptions

The TLBIMVAAL input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

**Bits [11:0]**

Reserved, RES0.

### Performing the TLBIMVAAL operation:

To perform the TLBIMVAAL operation:

```
MCR p15,0,<Rt>,c8,c7,7 ; TLBIMVAAL operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |

### G6.2.143 TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for the last level of translation, for any ASID, that match the given VA, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAAL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

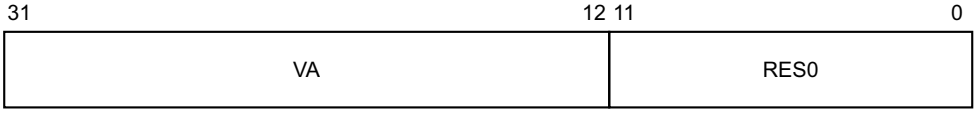
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVAALIS is a 32-bit system operation.

#### Field descriptions

### G6.2.144 TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime that match the given VA.

For details of the scope of this instruction see TLBIMVAH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

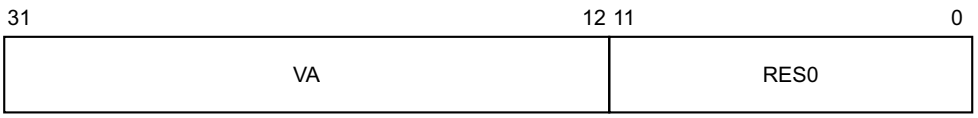
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIMVAH is a 32-bit system operation.

#### Field descriptions

The TLBIMVAH input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:0]**

Reserved, RES0.

### Performing the TLBIMVAH operation:

To perform the TLBIMVAH operation:

```
MCR p15,4,<Rt>,c8,c7,1 ; TLBIMVAH operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0111 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.145 TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime that match the given VA, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIMVAH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

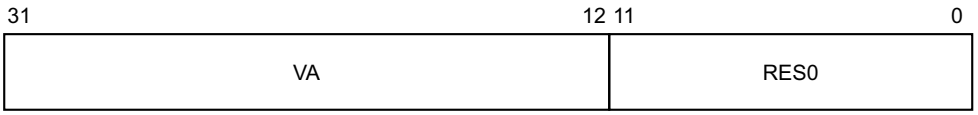
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIMVAHIS is a 32-bit system operation.

#### Field descriptions

The TLBIMVAHIS input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:0]**

Reserved, RES0.

### Performing the TLBIMVAHIS operation:

To perform the TLBIMVAHIS operation:

```
MCR p15,4,<Rt>,c8,c3,1 ; TLBIMVAHIS operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.146 TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime that match the given VA and ASID, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVA.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

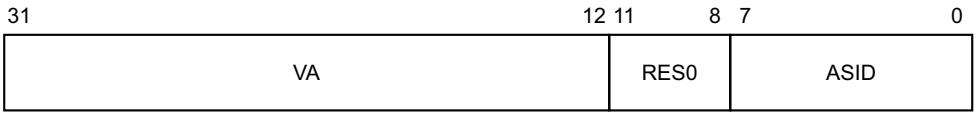
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



There are no configuration notes.

**Attributes**

TLBIMVAIS is a 32-bit system operation.

#### Field descriptions

The TLBIMVAIS input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Performing the TLBIMVAIS operation:

To perform the TLBIMVAIS operation:

```
MCR p15,0,<Rt>,c8,c3,1 ; TLBIMVAIS operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.147 TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

**Purpose**

Invalidate TLB entries for the stage 1 PL1&0 translation regime, for the last level of translation, that match the given VA and ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

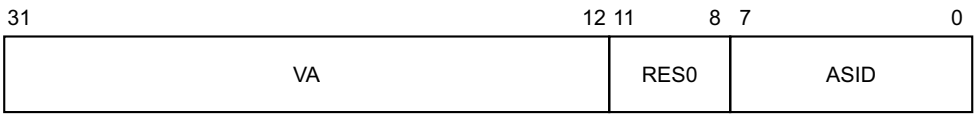
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVAL is a 32-bit system operation.

#### Field descriptions

The TLBIMVAL input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Performing the TLBIMVAL operation:

To perform the TLBIMVAL operation:

```
MCR p15,0,<Rt>,c8,c7,5 ; TLBIMVAL operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0111 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.148 TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime, for the last level of translation, that match the given VA.

For details of the scope of this instruction see TLBIMVALH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

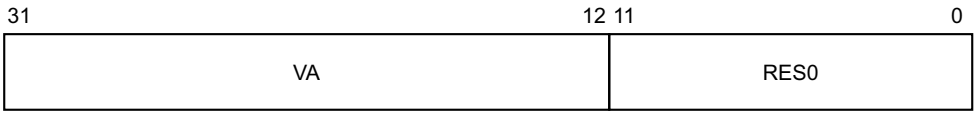
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVALH is a 32-bit system operation.

## Field descriptions

The TLBIMVALH input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:0]**

Reserved, RES0.

### Performing the TLBIMVALH operation:

To perform the TLBIMVALH operation:

```
MCR p15,4,<Rt>,c8,c7,5 ; TLBIMVALH operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0111 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.149 TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime, for the last level of translation, that match the given VA, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIMVALH.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0, Mon) | EL3 (SCR.NS=0, !Mon) |
|---|---|---|---|---|---|---|
| - | - | - | WO | WO | WO | WO-UNPREDICTABLE |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | WO |

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see *Hyp mode TLB maintenance instructions* on page K1-5499.

**Traps and Enables**

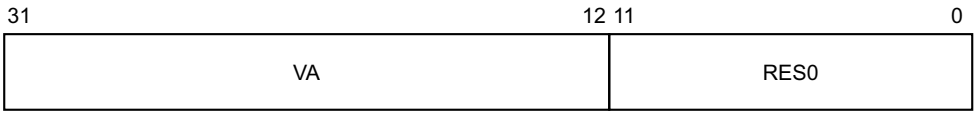
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVALHIS is a 32-bit system operation.

## Field descriptions

The TLBIMVALHIS input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:0]**

Reserved, RES0.

### Performing the TLBIMVALHIS operation:

To perform the TLBIMVALHIS operation:

```
MCR p15,4,<Rt>,c8,c3,5 ; TLBIMVALHIS operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1000 | 0011 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.150 TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for the last level of translation, that match the given VA and ASID, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAL.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

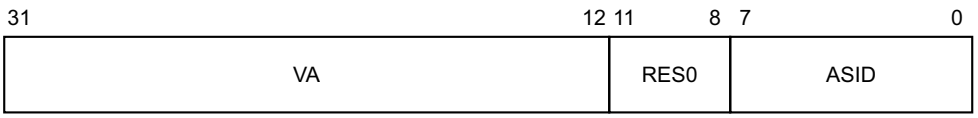
If HCR.TTLB==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure EL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**



This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVALIS is a 32-bit system operation.

#### Field descriptions

The TLBIMVALIS input value bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Performing the TLBIMVALIS operation:

To perform the TLBIMVALIS operation:

```
MCR p15,0,<Rt>,c8,c3,5 ; TLBIMVALIS operation
```

The operation is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1000 | 0011 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.2.151 TLBTR, TLB Type Register

The TLBTR characteristics are:

**Purpose**

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

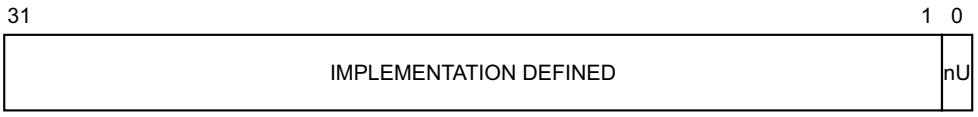
If HCR.TID1==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID1==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

TLBTR is a 32-bit register.

### Field descriptions

The TLBTR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:1]**

IMPLEMENTATION DEFINED.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**nU, bit [0]**

Not Unified TLB. Indicates whether the implementation has a unified TLB:

0 Unified TLB.

1 Separate Instruction and Data TLBs.

### Accessing the TLBTR:

To access the TLBTR:

```
MRC p15,0,<Rt>,c0,c0,3 ; Read TLBTR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0000 | 0000 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.152 TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TPIDRPRW(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

TPIDRPRW(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TPIDRPRW is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

The PE never updates this register. This means the register is always UNKNOWN on reset.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

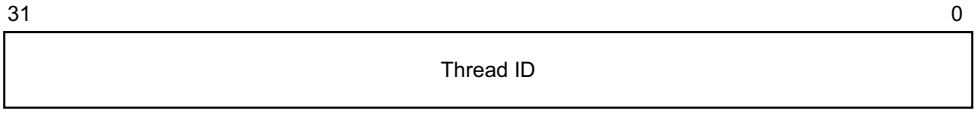
Subject to the prioritization rules:

If HSTR.T13==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TPIDRPRW is architecturally mapped to AArch64 System register TPIDR_EL1[31:0].



**Attributes**

TPIDRPRW is a 32-bit register.

#### Field descriptions

The TPIDRPRW bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRPRW:

To access the TPIDRPRW:

```
MRC p15,0,<Rt>,c13,c0,4 ; Read TPIDRPRW into Rt
MCR p15,0,<Rt>,c13,c0,4 ; Write Rt to TPIDRPRW
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1101 | 0000 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.153 TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TPIDRURO(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RO | - | - | - | RW |

TPIDRURO(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RO | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TPIDRURO is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| RO | RW | RW |

The PE never updates this register. This means the register is always UNKNOWN on reset.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

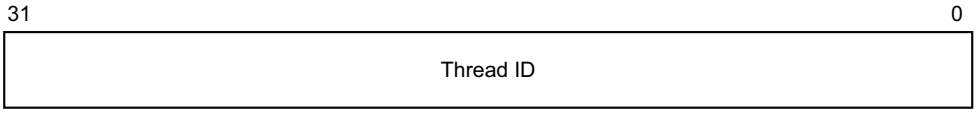
Subject to the prioritization rules:

If HSTR.T13==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TPIDRURO is architecturally mapped to AArch64 System register TPIDRRO_EL0[31:0].



**Attributes**

TPIDRURO is a 32-bit register.

#### Field descriptions

The TPIDRURO bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRURO:

To access the TPIDRURO:

```
MRC p15,0,<Rt>,c13,c0,3 ; Read TPIDRURO into Rt
MCR p15,0,<Rt>,c13,c0,3 ; Write Rt to TPIDRURO
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1101 | 0000 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.154 TPIDRURW, PL0 Read/Write Software Thread ID Register

The TPIDRURW characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TPIDRURW(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | - | - | - | RW |

TPIDRURW(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TPIDRURW is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| RW | RW | RW |

The PE never updates this register. This means the register is always UNKNOWN on reset.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

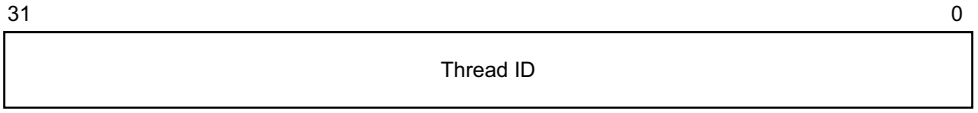
Subject to the prioritization rules:

If HSTR.T13==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TPIDRURW is architecturally mapped to AArch64 System register TPIDR_EL0[31:0].



**Attributes**

TPIDRURW is a 32-bit register.

#### Field descriptions

The TPIDRURW bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRURW:

To access the TPIDRURW:

```
MRC p15,0,<Rt>,c13,c0,2 ; Read TPIDRURW into Rt
MCR p15,0,<Rt>,c13,c0,2 ; Write Rt to TPIDRURW
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1101 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.155 TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

**Purpose**

Determines which of the Translation Table Base Registers defined the base address for a translation table walk required for the stage 1 translation of a memory access from any mode other than Hyp mode. Also controls the translation table format and, when using the Long-descriptor translation table format, holds cacheability and shareability information.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TTBCR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

TTBCR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TTBCR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TTBCR is architecturally mapped to AArch64 System register TCR_EL1[31:0].

The current translation table format determines which format of the register is used.

When EL3 is using AArch32, write access to TTBCR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

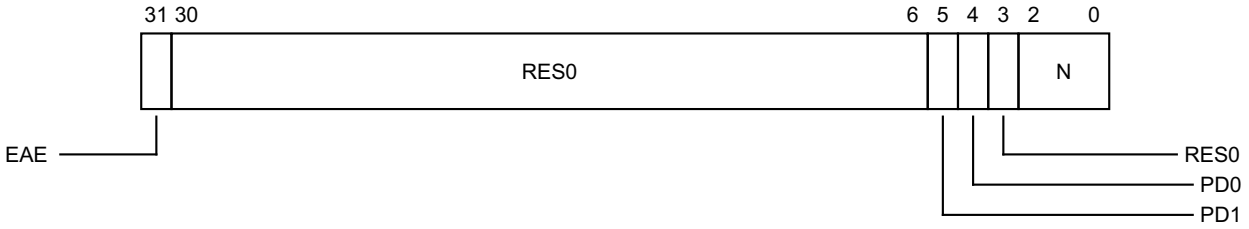
**Attributes**

TTBCR is a 32-bit register.

## Field descriptions

The TTBCR bit assignments are:

***For all register layouts:***



**EAE, bit [31]**

Extended Address Enable. The meanings of the possible values of this bit are:

`0` Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

`1` Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

***When TTBCR.EAE==0:***

**EAE, bit [31]**

Extended Address Enable. The meanings of the possible values of this bit are:

`0` Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bits [30:6]**

Reserved, RES0.

**PD1, bit [5]**

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1. The encoding of this bit is:

`0` Perform translation table walks using TTBR1.

`1` A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PD0, bit [4]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0. The encoding of this bit is:

`0` Perform translation table walks using TTBR0.

`1` A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

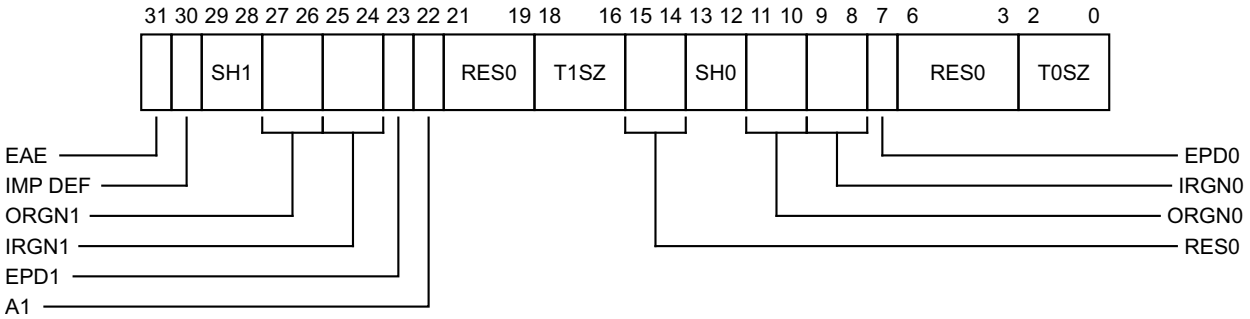
When this register has an architecturally-defined reset value, this field resets to `0`.

**Bit [3]**

Reserved, RES0.

**N, bits [2:0]**

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:



- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from `0b000` to `0b111`.

When N has its reset value of 0, the translation table base is compatible with ARMv5 and ARMv6.

When this register has an architecturally-defined reset value, this field resets to `0`.

***When TTBCR.EAE==1:***

**EAE, bit [31]**

Extended Address Enable. The meanings of the possible values of this bit are:

`1` Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

When this register has an architecturally-defined reset value, this field resets to `0`.

**IMP DEF, bit [30]**

IMPLEMENTATION DEFINED.

When this register has an architecturally-defined reset value, this field resets to `0`.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using TTBR1.

`00` Non-shareable

`10` Outer Shareable

`11` Inner Shareable

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

When this register has an architecturally-defined reset value, this field resets to 0.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1.

00 Normal memory, Outer Non-cacheable

01 Normal memory, Outer Write-Back Write-Allocate Cacheable

10 Normal memory, Outer Write-Through Cacheable

11 Normal memory, Outer Write-Back no Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1.

00 Normal memory, Inner Non-cacheable

01 Normal memory, Inner Write-Back Write-Allocate Cacheable

10 Normal memory, Inner Write-Through Cacheable

11 Normal memory, Inner Write-Back no Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

**EPD1, bit [23]**

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1. The encoding of this bit is:

0 Perform translation table walks using TTBR1.

1 A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

**A1, bit [22]**

Selects whether TTBR0 or TTBR1 defines the ASID. The encoding of this bit is:

0 TTBR0.ASID defines the ASID.

1 TTBR1.ASID defines the ASID.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [21:19]**

Reserved, RES0.

**T1SZ, bits [18:16]**

See *Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format* on page G4-4026 for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [15:14]**

Reserved, RES0.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0.

00 Non-shareable

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

10 Outer Shareable

11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

When this register has an architecturally-defined reset value, this field resets to 0.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

00 Normal memory, Outer Non-cacheable

01 Normal memory, Outer Write-Back Write-Allocate Cacheable

10 Normal memory, Outer Write-Through Cacheable

11 Normal memory, Outer Write-Back no Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

00 Normal memory, Inner Non-cacheable

01 Normal memory, Inner Write-Back Write-Allocate Cacheable

10 Normal memory, Inner Write-Through Cacheable

11 Normal memory, Inner Write-Back no Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0. The encoding of this bit is:

0 Perform translation table walks using TTBR0.

1 A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [6:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

See *Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format* on page G4-4026 for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the TTBCR:

To access the TTBCR:

```
MRC p15,0,<Rt>,c2,c0,2 ; Read TTBCR into Rt
MCR p15,0,<Rt>,c2,c0,2 ; Write Rt to TTBCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0010 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.156 TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

**Purpose**

Holds the base address of translation table 0, and information about the memory it occupies. This is one of the translation tables for the stage 1 translation of memory accesses from modes other than Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TTBR0(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

TTBR0(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TTBR0 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TTBR0 is architecturally mapped to AArch64 System register TTBR0_EL1.

TTBCR.EAE determines which TTBR0 format is used:

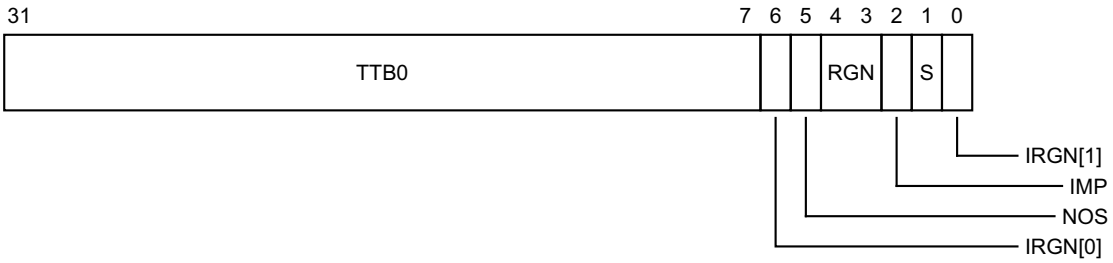
`EAE==0` 32-bit format is used. TTBR0[63:32] are ignored.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

EAE==1 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

## Field descriptions

The TTBR0 bit assignments are:

***When TTBCR.EAE==0:***

**TTB0, bits [31:7]**

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

**IRGN[0], bit [6]**

See IRGN[1] below for description of the IRGN field.

**NOS, bit [5]**

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

0 Memory is Outer Shareable.

1 Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

**RGN, bits [4:3]**

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

00 Normal memory, Outer Non-cacheable.

01 Normal memory, Outer Write-Back Write-Allocate Cacheable.

10 Normal memory, Outer Write-Through Cacheable.

11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMP, bit [2]**

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is UNK/SBZP.

**S, bit [1]**

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

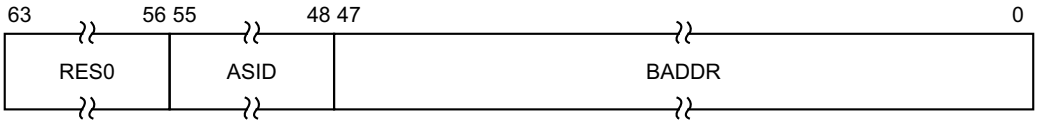
0 Memory is Non-shareable.

1 Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

**IRGN[1], bit [0]**

Inner region bits. Indicates the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

00 Normal memory, Inner Non-cacheable.



01 Normal memory, Inner Write-Back Write-Allocate Cacheable.

10 Normal memory, Inner Write-Through Cacheable.

11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

***When TTBCR.EAE==1:***

**Bits [63:56]**

Reserved, RES0.

**ASID, bits [55:48]**

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

**BADDR, bits [47:0]**

Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the TTBR0:

To access the TTBR0 when accessing as a 32-bit register:

```
MRC p15,0,<Rt>,c2,c0,0 ; Read TTBR0[31:0] into Rt
MCR p15,0,<Rt>,c2,c0,0 ; Write Rt to TTBR0[31:0]. TTBR0[63:32] are unchanged
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0010 | 0000 | 000 |

To access the TTBR0 when accessing as a 64-bit register:

```
MRRC p15,0,<Rt>,<Rt2>,c2 ; Read TTBR0[31:0] into Rt and TTBR0[63:32] into Rt2
MCRR p15,0,<Rt>,<Rt2>,c2 ; Write Rt to TTBR0[31:0] and Rt2 to TTBR0[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0000 | 0010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.157 TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

**Purpose**

Holds the base address of translation table 1, and information about the memory it occupies. This is one of the translation tables for the stage 1 translation of memory accesses from modes other than Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TTBR1(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

TTBR1(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TTBR1 is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HCR.TVM==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TTBR1 is architecturally mapped to AArch64 System register TTBR1_EL1.

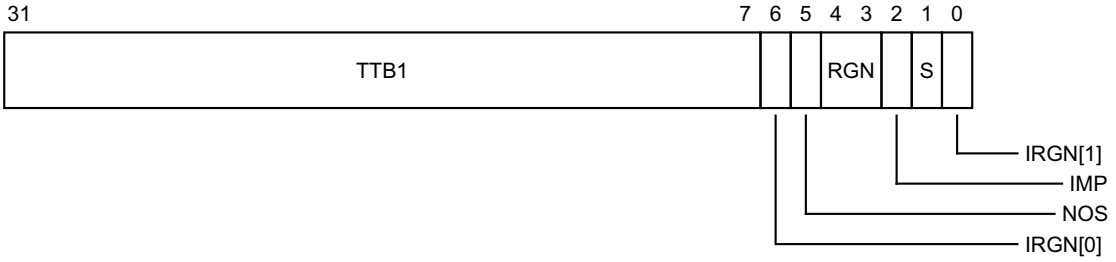
TTBCR.EAE determines which TTBR1 format is used:

`EAE==0` 32-bit format is used. TTBR1[63:32] are ignored.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

EAE==1 64-bit format is used.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

## Field descriptions

The TTBR1 bit assignments are:

***When TTBCR.EAE==0:***

**TTB1, bits [31:7]**

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

**IRGN[0], bit [6]**

See IRGN[1] below for description of the IRGN field.

**NOS, bit [5]**

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

0 Memory is Outer Shareable.

1 Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

**RGN, bits [4:3]**

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

00 Normal memory, Outer Non-cacheable.

01 Normal memory, Outer Write-Back Write-Allocate Cacheable.

10 Normal memory, Outer Write-Through Cacheable.

11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

**IMP, bit [2]**

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is UNK/SBZP.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**S, bit [1]**

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

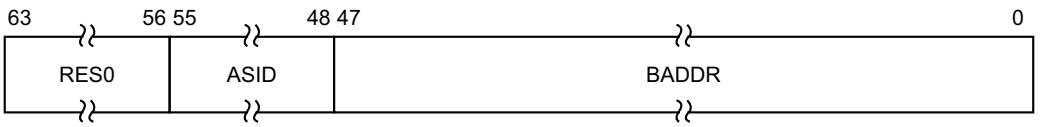
0 Memory is Non-shareable.

1 Memory is shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

**IRGN[1], bit [0]**

Inner region bits. Indicates the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

00 Normal memory, Inner Non-cacheable.



01 Normal memory, Inner Write-Back Write-Allocate Cacheable.

10 Normal memory, Inner Write-Through Cacheable.

11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

***When TTBCR.EAE==1:***

**Bits [63:56]**

Reserved, RES0.

**ASID, bits [55:48]**

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

**BADDR, bits [47:0]**

Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

## Accessing the TTBR1:

To access the TTBR1 when accessing as a 32-bit register:

```
MRC p15,0,<Rt>,c2,c0,1 ; Read TTBR1[31:0] into Rt
MCR p15,0,<Rt>,c2,c0,1 ; Write Rt to TTBR1[31:0]. TTBR1[63:32] are unchanged
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0010 | 0000 | 001 |

To access the TTBR1 when accessing as a 64-bit register:

```
MRRC p15,1,<Rt>,<Rt2>,c2 ; Read TTBR1[31:0] into Rt and TTBR1[63:32] into Rt2
MCRR p15,1,<Rt>,<Rt2>,c2 ; Write Rt to TTBR1[31:0] and Rt2 to TTBR1[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0001 | 0010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.158 VBAR, Vector Base Address Register

The VBAR characteristics are:

**Purpose**

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

VBAR(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | - | RW |

VBAR(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

VBAR is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

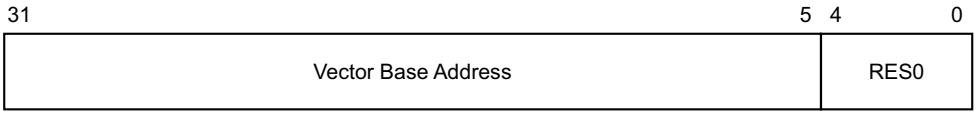
If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VBAR is architecturally mapped to AArch64 System register VBAR_EL1[31:0].

When EL3 is using AArch32, write access to VBAR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

VBAR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The VBAR bit assignments are:

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED value.

**Bits [4:0]**

Reserved, RES0.

### Accessing the VBAR:

To access the VBAR:

```
MRC p15,0,<Rt>,c12,c0,0 ; Read VBAR into Rt
MCR p15,0,<Rt>,c12,c0,0 ; Write Rt to VBAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1100 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.159 VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

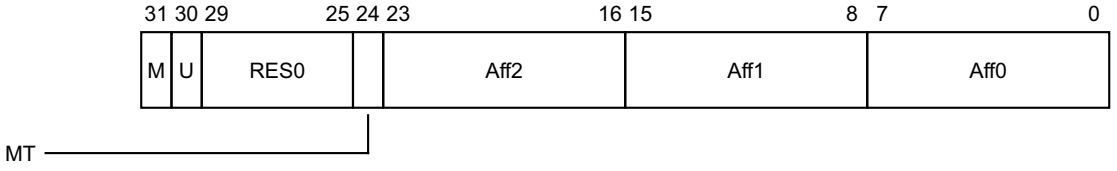
If HSTR.T0==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VMPIDR is architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VMPIDR is a 32-bit register.

#### Field descriptions

The VMPIDR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.

1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.

In ARMv8 this bit is RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

0 Processor is part of a multiprocessor system.

1 Processor is part of a uniprocessor system.

When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.U.

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. The possible values of this bit are:

0 Performance of PEs at the lowest affinity level is largely independent.

1 Performance of PEs at the lowest affinity level is very interdependent.

When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.MT.

**Aff2, bits [23:16]**

Affinity level 2. The least significant affinity level field, for this PE in the system.

When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.Aff2.

**Aff1, bits [15:8]**

Affinity level 1. The intermediate affinity level field, for this PE in the system.

When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.Aff1.

**Aff0, bits [7:0]**

Affinity level 0. The most significant affinity level field, for this PE in the system.

When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.Aff0.

## Accessing the VMPIDR:

To access the VMPIDR:

```
MRC p15,4,<Rt>,c0,c0,5 ; Read VMPIDR into Rt
MCR p15,4,<Rt>,c0,c0,5 ; Write Rt to VMPIDR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0000 | 0000 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.160 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

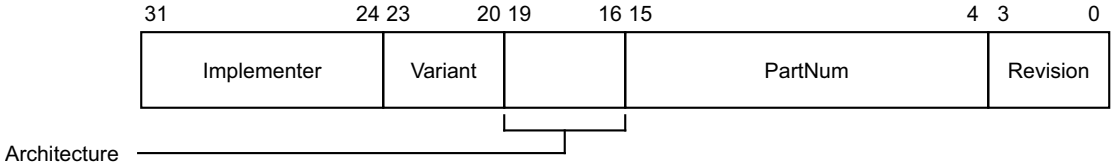
If HSTR.T0==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VPIDR is architecturally mapped to AArch64 System register VPIDR_EL2.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VPIDR is a 32-bit register.

#### Field descriptions

The VPIDR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

| Hex representation | ASCII representation | Implementer |
|---|---|---|
| 0x41 | A | ARM Limited |
| 0x42 | B | Broadcom Corporation |
| 0x43 | C | Cavium Inc. |
| 0x44 | D | Digital Equipment Corporation |
| 0x49 | I | Infineon Technologies AG |
| 0x4D | M | Motorola or Freescale Semiconductor Inc. |
| 0x4E | N | NVIDIA Corporation |
| 0x50 | P | Applied Micro Circuits Corporation |
| 0x51 | Q | Qualcomm Inc. |
| 0x56 | V | Marvell International Ltd. |
| 0x69 | i | Intel Corporation |

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Implementer.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Variant.

**Architecture, bits [19:16]**

The permitted values of this field are:

0001 ARMv4

0010 ARMv4T

0011 ARMv5 (obsolete)

0100 ARMv5T

0101 ARMv5TE

0110 ARMv5TEJ

0111 ARMv6

1111 Architectural features are individually identified in the ID_* registers, see *Identification registers, functional group* on page G4-4162.

All other values are reserved.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Architecture.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

On processors implemented by ARM, if the top four bits of the primary part number are `0x0` or `0x7`, the variant and architecture are encoded differently.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.PartNum.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Revision.

## Accessing the VPIDR:

To access the VPIDR:

```
MRC p15,4,<Rt>,c0,c0,0 ; Read VPIDR into Rt
MCR p15,4,<Rt>,c0,c0,0 ; Write Rt to VPIDR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0000 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.161 VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

**Purpose**

Controls the translation table walks required for the stage 2 translation of memory accesses from Non-secure modes other than Hyp mode, and holds cacheability and shareability information for the accesses.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Used in conjunction with VTTBR, that defines the translation table base address for the translations.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

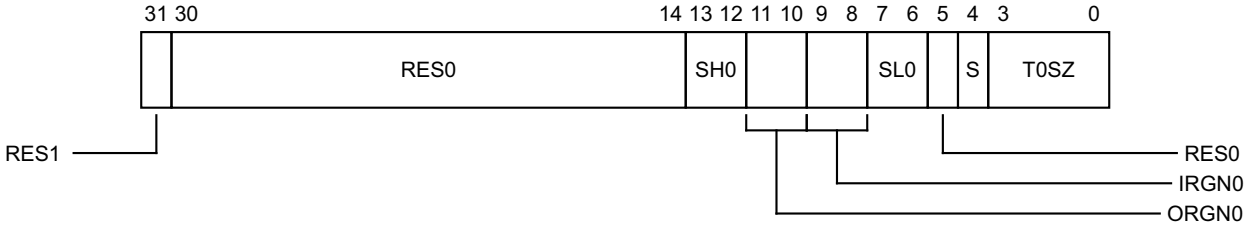
If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VTCR is architecturally mapped to AArch64 System register VTCR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

VTCR is a 32-bit register.

#### Field descriptions

The VTCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [31]**

Reserved, RES1.

**Bits [30:14]**

Reserved, RES0.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using VTTBR.

00 Non-shareable

10 Outer Shareable

11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using VTTBR.

00 Normal memory, Outer Non-cacheable

01 Normal memory, Outer Write-Back Write-Allocate Cacheable

10 Normal memory, Outer Write-Through Cacheable

11 Normal memory, Outer Write-Back no Write-Allocate Cacheable

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using VTTBR.

00 Normal memory, Inner Non-cacheable

01 Normal memory, Inner Write-Back Write-Allocate Cacheable

10 Normal memory, Inner Write-Through Cacheable

11 Normal memory, Inner Write-Back no Write-Allocate Cacheable

**SL0, bits [7:6]**

Starting level for translation table walks using VTTBR.

00 Start at level 2

01 Start at level 1

All other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

If the stage 2 input address size, as programmed in VTCR.T0SZ, is out of range with respect to the starting level at the time of a translation walk that uses the stage 2 translation, then a second stage level 1 translation fault is generated.

**Bit [5]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**S, bit [4]**

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value.

**T0SZ, bits [3:0]**

The size offset of the memory region addressed by VTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7. This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

## Accessing the VTCR:

To access the VTCR:

```
MRC p15,4,<Rt>,c2,c1,2 ; Read VTCR into Rt
MCR p15,4,<Rt>,c2,c1,2 ; Write Rt to VTCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0010 | 0001 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.2.162 VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the stage 2 translation of memory accesses from Non-secure modes other than Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Used in conjunction with the VTCR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

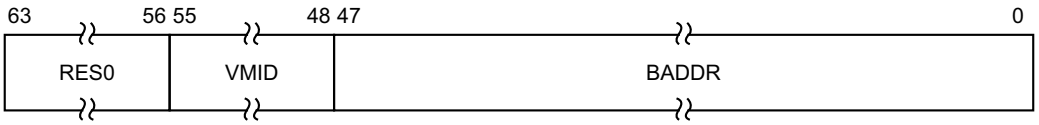
If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VTTBR is architecturally mapped to AArch64 System register VTTBR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VTTBR is a 64-bit register.

#### Field descriptions

The VTTBR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [63:56]**

Reserved, RES0.

**VMID, bits [55:48]**

The VMID for the translation table.

When this register has an architecturally-defined reset value, this field resets to `0`.

**BADDR, bits [47:0]**

Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.T0SZ as follows:

- If VTCR.T0SZ is 0 or 1, x = 5 - VTCR.T0SZ.
- If VTCR.T0SZ is greater than 1, x = 14 - VTCR.T0SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

## Accessing the VTTBR:

To access the VTTBR:

```
MRRC p15,6,<Rt>,<Rt2>,c2 ; Read VTTBR[31:0] into Rt and VTTBR[63:32] into Rt2
MCRR p15,6,<Rt>,<Rt2>,c2 ; Write Rt to VTTBR[31:0] and Rt2 to VTTBR[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0110 | 0010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.3 Debug registers

This section lists the Debug System registers in AArch32 state, in alphabetic order.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.1 DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

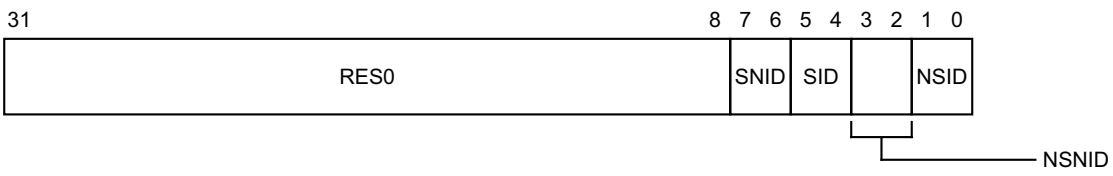
If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGAUTHSTATUS is architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1.

AArch32 System register DBGAUTHSTATUS is architecturally mapped to External register DBGAUTHSTATUS_EL1.



This register is required in all implementations.

**Attributes**

DBGAUTHSTATUS is a 32-bit register.

#### Field descriptions

The DBGAUTHSTATUS bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Secure non-invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.

10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**SID, bits [5:4]**

Secure invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.

10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

Other values are reserved.

**NSNID, bits [3:2]**

Non-secure non-invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.

10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.

10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

Other values are reserved.

### Accessing the DBGAUTHSTATUS:

To access the DBGAUTHSTATUS:

```
MRC p14,0,<Rt>,c7,c14,6 ; Read DBGAUTHSTATUS into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0111 | 1110 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.2 DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

When the E field is zero, all the other fields in the register are ignored.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state.
- *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.
- *Software Access debug event* on page H3-4881 for accesses to this register taken to Debug state.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1 and EL2 accesses to this register generate a Software Access debug event.

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

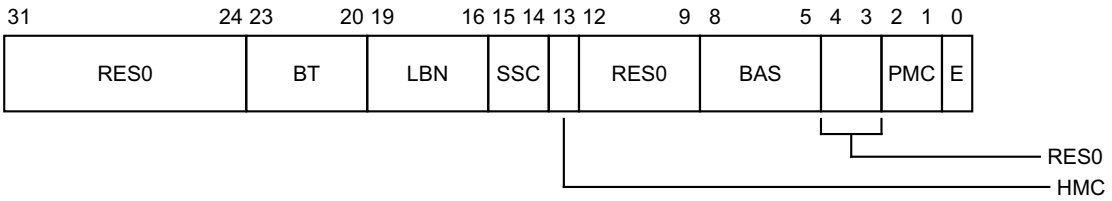
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGBCR<n> is architecturally mapped to AArch64 System register DBGBCR<n>_EL1.

AArch32 System register DBGBCR<n> is architecturally mapped to External register DBGBCR<n>_EL1.

If breakpoint n is not implemented then this register is unallocated.



**Attributes**

DBGBCR<n> is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The DBGBCR<n> bit assignments are:

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:

`0000` Unlinked instruction address match.

`0001` Linked instruction address match.

`0010` Unlinked context ID match.

`0011` Linked context ID match

`0100` Unlinked instruction address mismatch.

`0101` Linked instruction address mismatch.

`1000` Unlinked VMID match.

`1001` Linked VMID match.

`1010` Unlinked VMID and context ID match.

`1011` Linked VMID and context ID match.

The field breaks down as follows:

- BT[3:1]: Base type.

  `000` Match address. DBGBVR<n> is the address of an instruction.

  `010` Mismatch address. Behaves as type `000` if in an AArch64 translation, or if Halting debug is enabled and halting is allowed. Otherwise, DBGBVR<n> is the address of an instruction to be stepped.

  `001` Match context ID. DBGBVR<n> is a context ID.

  `100` Match VMID. DBGBXVR<n>.VMID is a VMID.

  `101` Match VMID and context ID. DBGBVR<n> is a context ID, and DBGBXVR<n>.VMID is a VMID.

- BT[0]: Enable linking.

Values `0b011x` and `0b11xx` are always reserved. Constraints on breakpoint programming mean other values are reserved under some conditions. For more information, including the effect of programming this field to a reserved value, see *Reserved DBGBCR<n>.BT values* on page G2-3915.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see *Usage constraints* on page G2-3914.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1. Otherwise:

- BAS[2] and BAS[0] are read/write.
- BAS[3] and BAS[1] are read-only copies of BAS[2] and BAS[0] respectively.

The values `0011` and `1100` are only supported if AArch32 is supported at any Exception level.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

| BAS | Match instruction at | Constraint for debuggers |
|---|---|---|
| `0011` | DBGBVR<n> | Use for T32 instructions. |
| `1100` | DBGBVR<n>+2 | Use for T32 instructions. |
| `1111` | DBGBVR<n> | Use for A32 instructions. |

`0000` is reserved and must behave as if the breakpoint is disabled or map to a permitted value.

For more information, see *Using the BAS field in Address Match breakpoints* on page G2-3909.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

| BAS | Step instruction at | Constraint for debuggers |
|---|---|---|
| 0000 | - | Use for a match anywhere breakpoint. |
| 0011 | DBGBVR<n> | Use for stepping T32 instructions. |
| 1100 | DBGBVR<n>+2 | Use for stepping T32 instructions. |
| 1111 | DBGBVR<n> | Use for stepping A32 instructions. |

For more information, see *Using the BAS field in Address Match breakpoints* on page G2-3909.

For Context matching breakpoints, this field is RES1 and ignored.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**E, bit [0]**

Enable breakpoint DBGBVR<n>. Possible values are:

0 Breakpoint disabled.

1 Breakpoint enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGBCR<n>:

To access the DBGBCR<n>:

```
MRC p14,0,<Rt>,c0,<CRm>,5 ; Read DBGBCR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,5 ; Write Rt to DBGBCR<n>, where n is in the range 0 to 15
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | n<3:0> | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.3 DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register DBGBCR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIDR.CTX_CMPs field.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state.
- *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.
- *Software Access debug event* on page H3-4881 for accesses to this register taken to Debug state.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1 and EL2 accesses to this register generate a Software Access debug event.

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

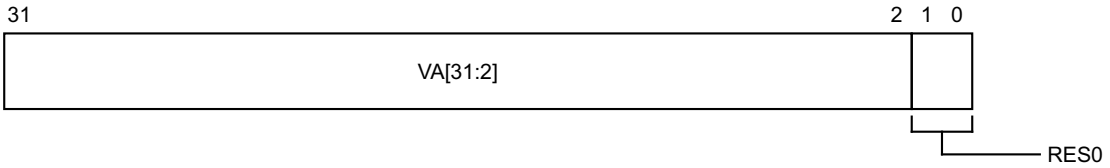
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGBVR<n> is architecturally mapped to AArch64 System register DBGBVR<n>_EL1[31:0].

AArch32 System register DBGBVR<n> is architecturally mapped to External register DBGBVR<n>_EL1[31:0].

If breakpoint n is not implemented then this register is unallocated.

**Attributes**



DBGBVR<n> is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

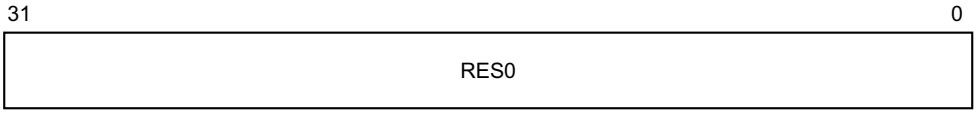
### Field descriptions

The DBGBVR<n> bit assignments are:

***When DBGBCR<n>.BT==0b0x0x:***

**VA[31:2], bits [31:2]**

Bits[31:2] of the address value for comparison.

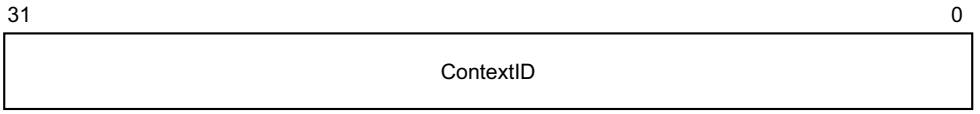


When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [1:0]**

Reserved, RES0.



***When DBGBCR<n>.BT==0b1x0x:***

**Bits [31:0]**

Reserved, RES0.

***When DBGBCR<n>.BT==0xxx1x:***

**ContextID, bits [31:0]**

Context ID value for comparison.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGBVR<n>:

To access the DBGBVR<n>:

```
MRC p14,0,<Rt>,c0,<CRm>,4 ; Read DBGBVR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,4 ; Write Rt to DBGBVR<n>, where n is in the range 0 to 15
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | n<3:0> | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.4 DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<n> and a value register DBGBVR<n>, where EL2 is implemented and breakpoint n supports Context matching.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state.
- *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.
- *Software Access debug event* on page H3-4881 for accesses to this register taken to Debug state.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1 and EL2 accesses to this register generate a Software Access debug event.

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

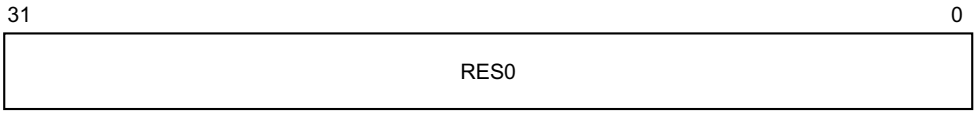
AArch32 System register DBGBXVR<n> is architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:32].

AArch32 System register DBGBXVR<n> is architecturally mapped to External register DBGBVR<n>_EL1[63:32].

This register is unallocated in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

**Attributes**

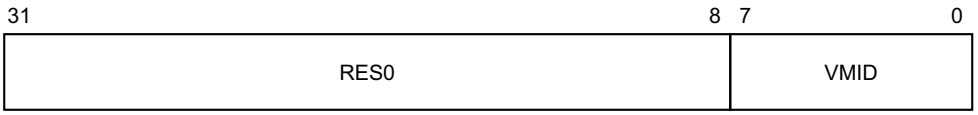


DBGBXVR<n> is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The DBGBXVR<n> bit assignments are:



***When DBGBCR<n>.BT==0b0xxx:***

**Bits [31:0]**

Reserved, RES0.

***When DBGBCR<n>.BT==0b1xxx and EL2 implemented:***

**Bits [31:8]**

Reserved, RES0.

**VMID, bits [7:0]**

VMID value for comparison.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGBXVR<n>:

To access the DBGBXVR<n>:

```
MRC p14,0,<Rt>,c1,<CRm>,1 ; Read DBGBXVR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c1,<CRm>,1 ; Write Rt to DBGBXVR<n>, where n is in the range 0 to 15
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0001 | n<3:0> | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.5 DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

The architecture does not define any functionality for the CLAIM tag bits.

Used in conjunction with the DBGCLAIMSET register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

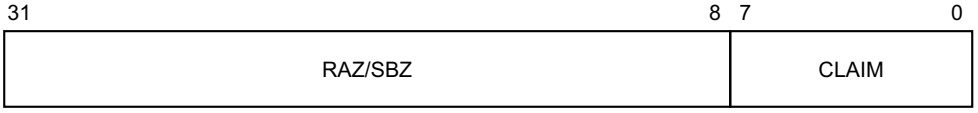
If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGCLAIMCLR is architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1.

AArch32 System register DBGCLAIMCLR is architecturally mapped to External register DBGCLAIMCLR_EL1.



An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMCLR is a 32-bit register.

#### Field descriptions

The DBGCLAIMCLR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

### Accessing the DBGCLAIMCLR:

To access the DBGCLAIMCLR:

```
MRC p14,0,<Rt>,c7,c9,6 ; Read DBGCLAIMCLR into Rt
MCR p14,0,<Rt>,c7,c9,6 ; Write Rt to DBGCLAIMCLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0111 | 1001 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.6 DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

The architecture does not define any functionality for the CLAIM tag bits.

Used in conjunction with the DBGCLAIMCLR register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

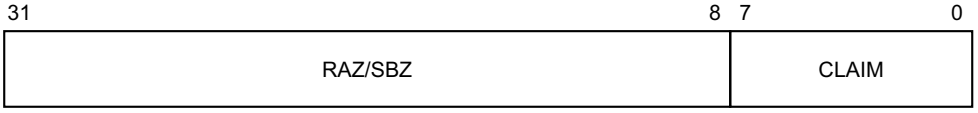
If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGCLAIMSET is architecturally mapped to AArch64 System register DBGCLAIMSET_EL1.

AArch32 System register DBGCLAIMSET is architecturally mapped to External register DBGCLAIMSET_EL1.



An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMSET is a 32-bit register.

#### Field descriptions

The DBGCLAIMSET bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

### Accessing the DBGCLAIMSET:

To access the DBGCLAIMSET:

```
MRC p14,0,<Rt>,c7,c8,6 ; Read DBGCLAIMSET into Rt
MCR p14,0,<Rt>,c7,c8,6 ; Write Rt to DBGCLAIMSET
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0111 | 1000 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.7 DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

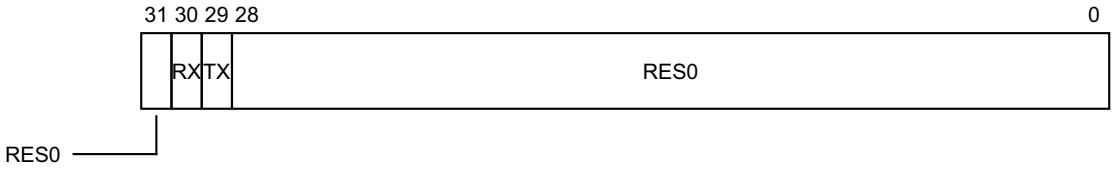
If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register DBGDCCINT is architecturally mapped to AArch64 System register MDCCINT_EL1.

**Attributes**

DBGDCCINT is a 32-bit register.

## Field descriptions

The DBGDCCINT bit assignments are:

**Bit [31]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**RX, bit [30]**

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

`0` No interrupt request generated by DTRRX.

`1` Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**TX, bit [29]**

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

`0` No interrupt request generated by DTRTX.

`1` Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**Bits [28:0]**

Reserved, RES0.

## Accessing the DBGDCCINT:

To access the DBGDCCINT:

```
MRC p14,0,<Rt>,c0,c2,0 ; Read DBGDCCINT into Rt
MCR p14,0,<Rt>,c0,c2,0 ; Write Rt to DBGDCCINT
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.8 DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

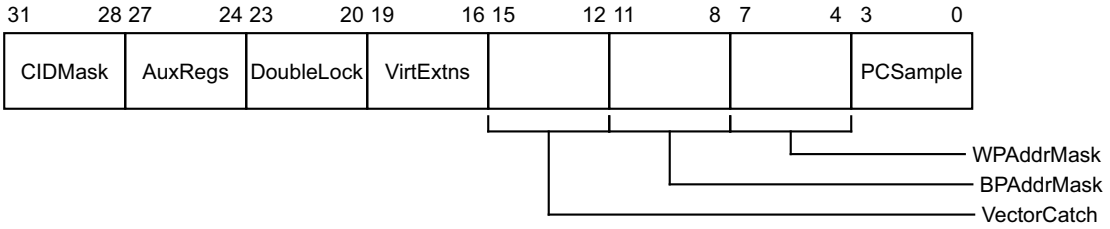
If HDCR.TDA==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



This register is required in all implementations.

**Attributes**

DBGDEVID is a 32-bit register.

## Field descriptions

The DBGDEVID bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CIDMask, bits [31:28]**

Indicates the level of support for the Context ID matching breakpoint masking capability. Permitted values of this field are:

0000 Context ID masking is not implemented.

0001 Context ID masking is implemented.

All other values are reserved. The value of this for ARMv8 is 0000.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

0000 None supported.

0001 Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

**DoubleLock, bits [23:20]**

Indicates the presence of the DBGOSDLR, OS Double Lock Register. Permitted values of this field are:

0000 The DBGOSDLR is not present.

0001 The DBGOSDLR is present.

All other values are reserved. The value of this for ARMv8 is 0001.

**VirtExtns, bits [19:16]**

Indicates whether EL2 is implemented. Permitted values of this field are:

0000 EL2 is not implemented.

0001 EL2 is implemented.

All other values are reserved.

**VectorCatch, bits [15:12]**

Defines the form of Vector catch debug event implemented. Permitted values of this field are:

0000 Address matching vector catch debug event implemented.

0001 Exception matching vector catch debug event implemented.

All other values are reserved.

**BPAddrMask, bits [11:8]**

Indicates the level of support for the IVA matching breakpoint masking capability. Permitted values of this field are:

0000 Breakpoint address masking may be implemented. If not implemented, DBGBCR<n>[28:24] is RAZ/WI.

0001 Breakpoint address masking is implemented.

1111 Breakpoint address masking is not implemented. DBGBCR<n>[28:24] is RES0.

All other values are reserved. The value of this for ARMv8 is 1111.

**WPAddrMask, bits [7:4]**

Indicates the level of support for the data VA matching watchpoint masking capability. Permitted values of this field are:

0000 Watchpoint address masking may be implemented. If not implemented, DBGWCR<n>.MASK (Address mask) is RAZ/WI.

0001 Watchpoint address masking is implemented.

1111 Watchpoint address masking is not implemented. DBGWCR<n>.MASK (Address mask) is RES0.

All other values are reserved. The value of this for ARMv8 is 0001.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PCSample, bits [3:0]**

Indicates the level of Sample-based profiling support using external debug registers 40 through 43. Permitted values of this field in ARMv8 are:

`0000` Architecture-defined form of Sample-based profiling not implemented.

`0010` EDPCSR and EDCIDSR are implemented (only permitted if EL3 and EL2 are not implemented).

`0011` EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

## Accessing the DBGDEVID:

To access the DBGDEVID:

```
MRC p14,0,<Rt>,c7,c2,7 ; Read DBGDEVID into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0111 | 0010 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.9 DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

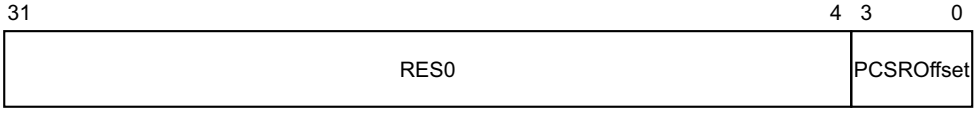
If HDCR.TDA==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



This register is required in all implementations.

**Attributes**

DBGDEVID1 is a 32-bit register.

## Field descriptions

The DBGDEVID1 bit assignments are:

**Bits [31:4]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in ARMv8 are:

`0000` EDPCSR not implemented.

`0010` EDPCSR implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

**Note**

In ARMv7, a PCSROffset value of `0000` has an alternative meaning that EDPCSR is implemented and returns values that have an offset applied and indicate the Instruction set state. This implementation option is not permitted in ARMv8.

## Accessing the DBGDEVID1:

To access the DBGDEVID1:

```
MRC p14,0,<Rt>,c7,c1,7 ; Read DBGDEVID1 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0111 | 0001 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.10 DBGDEVID2, Debug Device ID register 2

The DBGDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

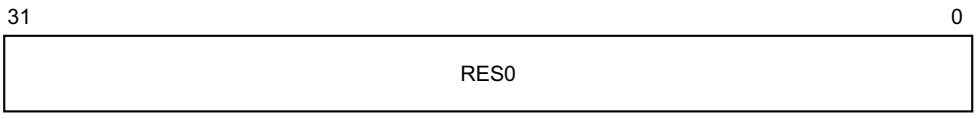
Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

DBGDEVID2 is a 32-bit register.

#### Field descriptions

The DBGDEVID2 bit assignments are:

**Bits [31:0]**

Reserved, RES0.

#### Accessing the DBGDEVID2:

To access the DBGDEVID2:

```
MRC p14,0,<Rt>,c7,c0,7 ; Read DBGDEVID2 into Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0111 | 0000 | 111 |

### G6.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

**Purpose**

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

ARM deprecates any access to this register from EL0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

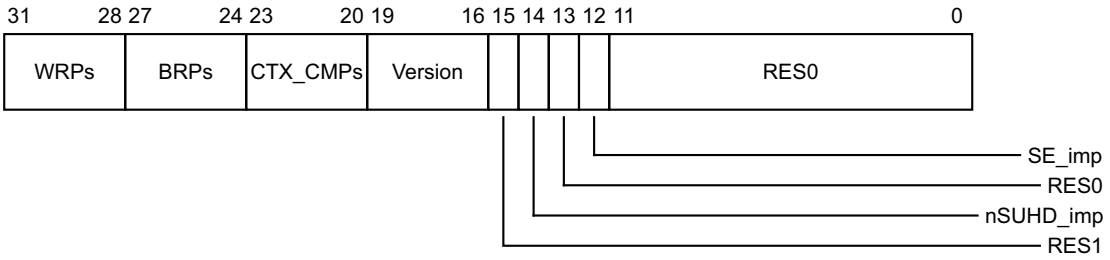
If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.



**Attributes**

DBGDIDR is a 32-bit register.

#### Field descriptions

The DBGDIDR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**WRPs, bits [31:28]**

The number of watchpoints implemented, minus 1.

Permitted values of this field are from `0b0001` for 2 implemented watchpoints, to `0b1111` for 16 implemented watchpoints.

The value of `0b0000` is reserved.

If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.WRPs.

**BRPs, bits [27:24]**

The number of breakpoints implemented, minus 1.

Permitted values of this field are from `0b0001` for 2 implemented breakpoint, to `0b1111` for 16 implemented breakpoints.

The value of `0b0000` is reserved.

If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.BRPs.

**CTX_CMPs, bits [23:20]**

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from `0b0000` for 1 Context matching breakpoint, to `0b1111` for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.CTX_CMPs.

**Version, bits [19:16]**

The Debug architecture version. Defined values are:

`0001` ARMv6, v6 Debug architecture

`0010` ARMv6, v6.1 Debug architecture

`0011` ARMv7, v7 Debug architecture, with baseline CP14 registers implemented

`0100` ARMv7, v7 Debug architecture, with all CP14 registers implemented

`0101` ARMv7, v7.1 Debug architecture.

`0110` ARMv8, v8 Debug architecture.

All other values are reserved.

**Bit [15]**

Reserved, RES1.

**nSUHD_imp, bit [14]**

In ARMv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [13]**

Reserved, RES0.

**SE_imp, bit [12]**

EL3 implemented. The meanings of the values of this bit are:

0 EL3 not implemented.

1 EL3 implemented.

The value of this bit must match the value of the nSUHD_imp bit.

**Bits [11:0]**

Reserved, RES0.

## Accessing the DBGDIDR:

To access the DBGDIDR:

```
MRC p14,0,<Rt>,c0,c0,0 ; Read DBGDIDR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.12 DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

ARMv8 deprecates any use of this register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDRA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDRA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

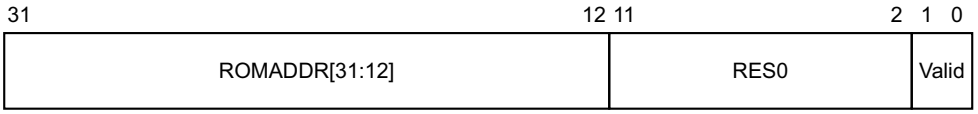
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDRAR is architecturally mapped to AArch64 System register MDRAR_EL1.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

**Attributes**



DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

#### Field descriptions

The DBGDRAR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

***When accessing as a 32-bit register:***

**ROMADDR[31:12], bits [31:12]**

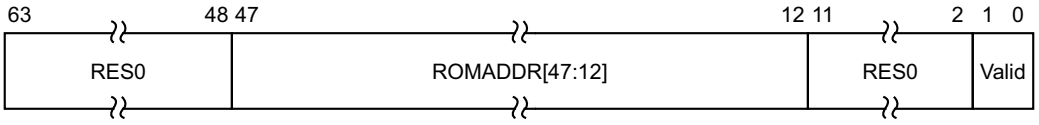
Bits[31:12] of the ROM table physical address. Bits [11:0] of the address are zero.

**Bits [11:2]**

Reserved, RES0.

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid. The permitted values of this field are:



`00` ROM Table address is not valid

`11` ROM Table address is valid.

Other values are reserved.

If no memory-mapped debug components are implemented, this field is RES0.

***When accessing as a 64-bit register:***

**Bits [63:48]**

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

**Bits [11:2]**

Reserved, RES0.

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

`00` ROM Table address is not valid

`11` ROM Table address is valid.

Other values are reserved.

If no memory-mapped debug components are implemented, this field is RES0.

## Accessing the DBGDRAR:

To access the DBGDRAR when accessing as a 32-bit register:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p14,0,<Rt>,c1,c0,0 ; Read DBGDRAR[31:0] into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0001 | 0000 | 000 |

To access the DBGDRAR when accessing as a 64-bit register:

```
MRRC p14,0,<Rt>,<Rt2>,c1 ; Read DBGDRAR[31:0] into Rt and DBGDRAR[63:32] into Rt2
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1110 | 0000 | 0001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.13 DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

**Purpose**

In earlier versions of the ARM Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. ARMv8 deprecates any use of this register.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

ARMv8 deprecates any use of this register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDRA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDRA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

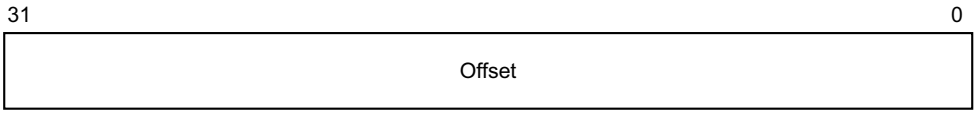
If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

**Attributes**

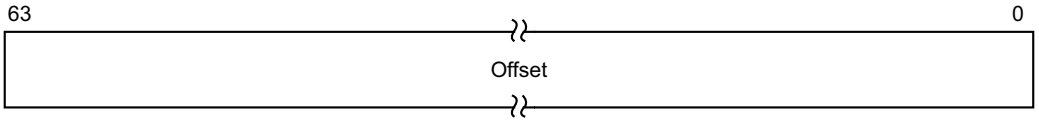


DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

#### Field descriptions

The DBGDSAR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



***When accessing as a 32-bit register:***

**Offset, bits [31:0]**

This register value is RAZ.

***When accessing as a 64-bit register:***

**Offset, bits [63:0]**

This register value is RAZ.

## Accessing the DBGDSAR:

To access the DBGDSAR when accessing as a 32-bit register:

```
MRC p14,0,<Rt>,c2,c0,0 ; Read DBGDSAR[31:0] into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0010 | 0000 | 000 |

To access the DBGDSAR when accessing as a 64-bit register:

```
MRRC p14,0,<Rt>,<Rt2>,c2 ; Read DBGDSAR[31:0] into Rt and DBGDSAR[63:32] into Rt2
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1110 | 0000 | 0010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

**Purpose**

Main control register for the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

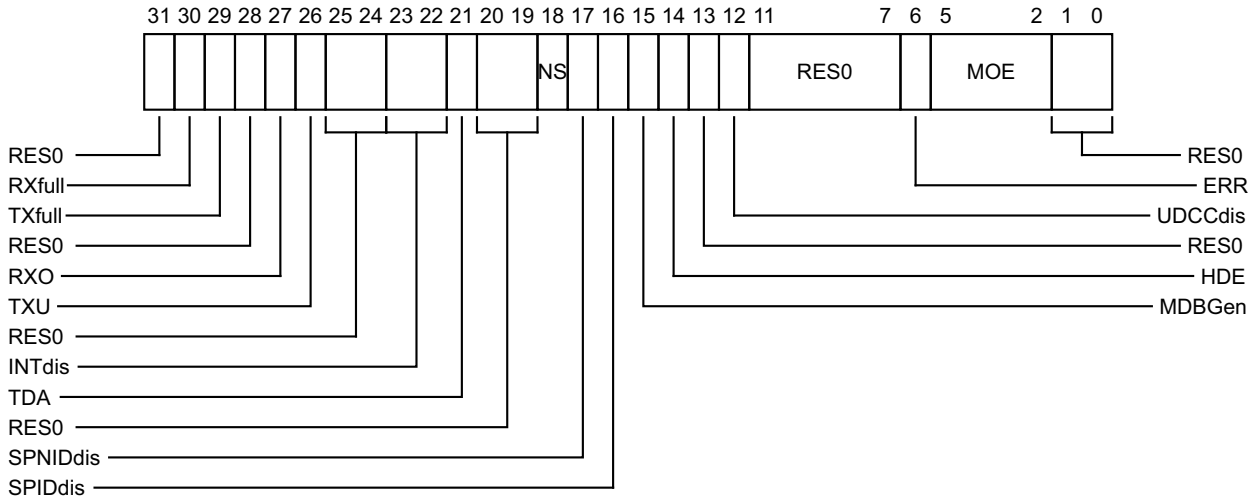
If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDSCRext is architecturally mapped to AArch64 System register MDSCR_EL1.

This register is required in all implementations.



**Attributes**

DBGDSCRext is a 32-bit register.

#### Field descriptions

The DBGDSCRext bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Used for save/restore of EDSCR.RXfull.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

ARM deprecates use of this bit other than for save/restore. Use DBGDSCRint to access the DTRRX full status.

**TXfull, bit [29]**

DTRTX full. Used for save/restore of EDSCR.TXfull.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

ARM deprecates use of this bit other than for save/restore. Use DBGDSCRint to access the DTRTX full status.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of EDSCR.RXO.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

**TXU, bit [26]**

Used for save/restore of EDSCR.TXU.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

**Bits [25:24]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**INTdis, bits [23:22]**

Used for save/restore of EDSCR.INTdis.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this field is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this field is RW.

**TDA, bit [21]**

Used for save/restore of EDSCR.TDA.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

**Bits [20:19]**

Reserved, RES0.

**NS, bit [18]**

Non-secure status. Returns the inverse of IsSecure(). This bit is RO.

ARM deprecates use of this field.

**SPNIDdis, bit [17]**

Secure privileged profiling disabled status bit. This bit is RO and reflects the value of ProfilingProhibited(TRUE,EL1). Permitted values are:

`0` Profiling allowed in Secure privileged modes.

`1` Profiling prohibited in Secure privileged modes.

ARM deprecates use of this field.

**SPIDdis, bit [16]**

Secure privileged AArch32 invasive self-hosted debug disabled status bit. This bit is RO and depends on the value of SDCR.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled(). Permitted values are:

`0` Self-hosted debug enabled in Secure privileged AArch32 modes.

`1` Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- SDCR.SPD has the value `10`.
- SDCR.SPD has the value `00` and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

ARM deprecates use of this field.

**MDBGen, bit [15]**

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector catch debug exceptions.

`0` Breakpoint, Watchpoint, and Vector catch debug exceptions disabled.

`1` Breakpoint, Watchpoint, and Vector catch debug exceptions enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**HDE, bit [14]**

Used for save/restore of EDSCR.HDE.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bit [13]**

Reserved, RES0.

**UDCCdis, bit [12]**

Traps PL0 accesses to the DCC registers to Undefined mode.

0 PL0 accesses to the DCC registers are not trapped to Undefined mode.

1 PL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.

**Note**

All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of PL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of EDSCR.ERR.

When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

**MOE, bits [5:2]**

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

0001 Breakpoint

0011 Software breakpoint (BKPT) instruction

0101 Vector catch

1010 Watchpoint

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [1:0]**

Reserved, RES0.

## Accessing the DBGDSCRext:

To access the DBGDSCRext:

```
MRC p14,0,<Rt>,c0,c2,2 ; Read DBGDSCRext into Rt
MCR p14,0,<Rt>,c0,c2,2 ; Write Rt to DBGDSCRext
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

**Purpose**

Main control register for the debug implementation. This is an internal, read-only view.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

**Configurations**

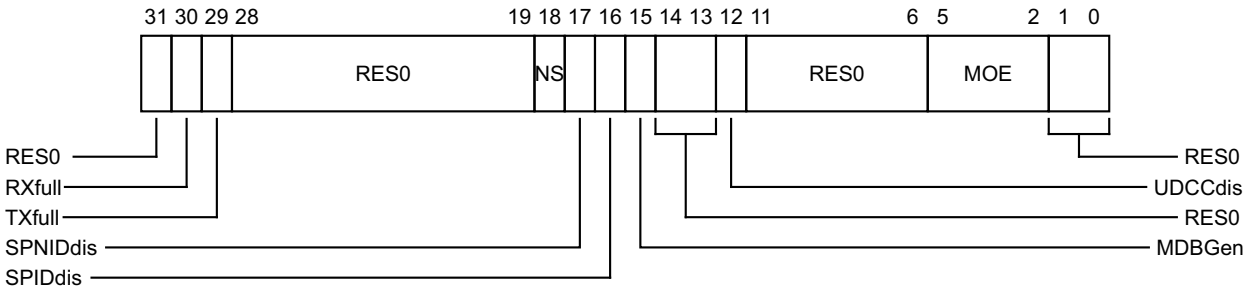
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDSCRint is architecturally mapped to AArch64 System register MDCCSR_EL0.

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)



**Attributes**

DBGDSCRint is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The DBGDSCRint bit assignments are:

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Read-only view of the equivalent bit in the EDSCR.

**TXfull, bit [29]**

DTRTX full. Read-only view of the equivalent bit in the EDSCR.

**Bits [28:19]**

Reserved, RES0.

**NS, bit [18]**

Non-secure status.

Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

**SPNIDdis, bit [17]**

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

**SPIDdis, bit [16]**

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

**MDBGen, bit [15]**

Monitor debug events enable.

Read-only view of the equivalent bit in the DBGDSCRext.

**Bits [14:13]**

Reserved, RES0.

**UDCCdis, bit [12]**

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

**Bits [11:6]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**MOE, bits [5:2]**

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

`0001` Breakpoint

`0011` Software breakpoint (BKPT) instruction

`0101` Vector catch

`1010` Watchpoint

Read-only view of the equivalent bit in the DBGDSCRext.

**Bits [1:0]**

Reserved, RES0.

## Accessing the DBGDSCRint:

To access the DBGDSCRint:

```
MRC p14,0,<Rt>,c0,c1,0 ; Read DBGDSCRint into Rt, where Rt can be R0-R14 or APSR_nzcv. The last form writes bits[31:28] of the transferred value to the N, Z, C and V condition flags and is specified by setting the RT field of the encoding to 0b1111.
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.16 DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

ARM deprecates reads and writes of DBGDTRRXext through the CP14 interface when the OS lock is unlocked.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

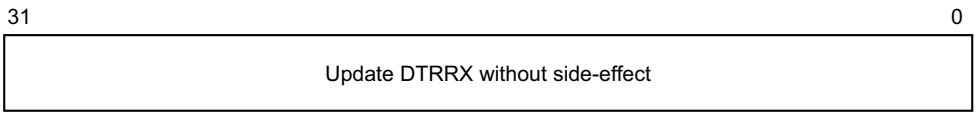
If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register DBGDTRRXext is architecturally mapped to AArch64 System register OSDTRRX_EL1.

**Attributes**

DBGDTRRXext is a 32-bit register.

## Field descriptions

The DBGDTRRXext bit assignments are:

**Bits [31:0]**

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGDTRRXext:

To access the DBGDTRRXext:

```
MRC p14,0,<Rt>,c0,c0,2 ; Read DBGDTRRXext into Rt
MCR p14,0,<Rt>,c0,c0,2 ; Write Rt to DBGDTRRXext
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.17 DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

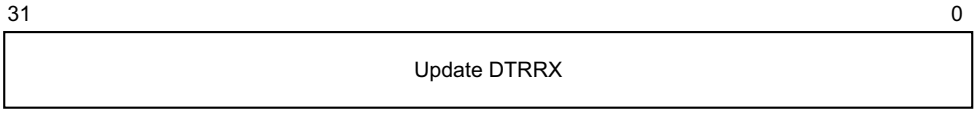
If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRRXint is architecturally mapped to AArch64 System register DBGDTRRX_EL0.

AArch32 System register DBGDTRRXint is architecturally mapped to External register DBGDTRRX_EL0.



**Attributes**

DBGDTRRXint is a 32-bit register.

#### Field descriptions

The DBGDTRRXint bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Update DTRRX.

If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

## Accessing the DBGDTRRXint:

To access the DBGDTRRXint:

```
MRC p14,0,<Rt>,c0,c5,0 ; Read DBGDTRRXint into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.18 DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRTXint. It is a component of the Debug Communication Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

ARM deprecates reads and writes of DBGDTRTXext through the CP14 interface when the OS lock is unlocked.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

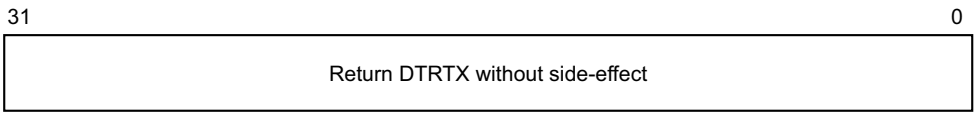
If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register DBGDTRTXext is architecturally mapped to AArch64 System register OSDTRTX_EL1.

**Attributes**

DBGDTRTXext is a 32-bit register.

## Field descriptions

The DBGDTRTXext bit assignments are:

**Bits [31:0]**

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGDTRTXext:

To access the DBGDTRTXext:

```
MRC p14,0,<Rt>,c0,c3,2 ; Read DBGDTRTXext into Rt
MCR p14,0,<Rt>,c0,c3,2 ; Write Rt to DBGDTRTXext
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0011 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.19 DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | Config-WO | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-WO | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 write accesses to this register are trapped to Undefined mode.

If HDCR.TDA==1, Non-secure EL0 and EL1 write accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL0 and EL1 write accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL0, PL1, and PL2 write accesses to this register are trapped to EL3.

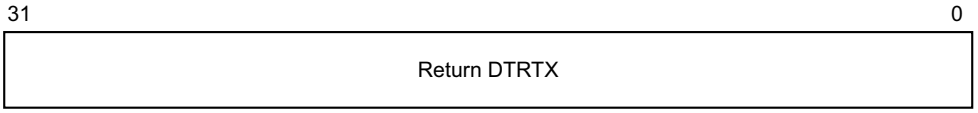
If MDSCR_EL1.TDCC==1, PL0 write accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRTXint is architecturally mapped to AArch64 System register DBGDTRTX_EL0.

AArch32 System register DBGDTRTXint is architecturally mapped to External register DBGDTRTX_EL0.



**Attributes**

DBGDTRTXint is a 32-bit register.

#### Field descriptions

The DBGDTRTXint bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

## Accessing the DBGDTRTXint:

To access the DBGDTRTXint:

```
MCR p14,0,<Rt>,c0,c5,0 ; Write Rt to DBGDTRTXint
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.20 DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

**Purpose**

Locks out the external debug interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

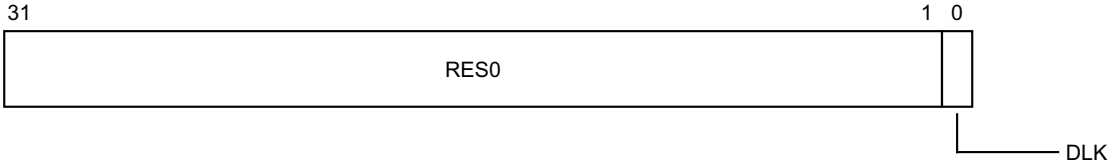
If HDCR.TDOSA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDOSA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDOSA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register DBGOSDLR is architecturally mapped to AArch64 System register OSDLR_EL1.

**Attributes**

DBGOSDLR is a 32-bit register.

## Field descriptions

The DBGOSDLR bit assignments are:

**Bits [31:1]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**DLK, bit [0]**

OS Double Lock control bit. Possible values are:

`0` OS Double Lock unlocked.

`1` OS Double Lock locked, if DBGPRCR.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

## Accessing the DBGOSDLR:

To access the DBGOSDLR:

```
MRC p14,0,<Rt>,c1,c3,4 ; Read DBGOSDLR into Rt
MCR p14,0,<Rt>,c1,c3,4 ; Write Rt to DBGOSDLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0001 | 0011 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.21 DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

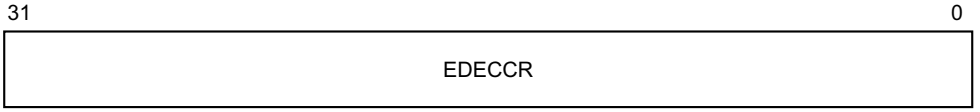
If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSECCR is architecturally mapped to AArch64 System register OSECCR_EL1.

AArch32 System register DBGOSECCR is architecturally mapped to External register EDECCR.



**Attributes**

DBGOSECCR is a 32-bit register.

#### Field descriptions

The DBGOSECCR bit assignments are:

***When OSLSR.OSLK==1:***

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EDECCR, bits [31:0]**

Used for save/restore to EDECCR over powerdown.

## Accessing the DBGOSECCR:

To access the DBGOSECCR:

```
MRC p14,0,<Rt>,c0,c6,2 ; Read DBGOSECCR into Rt
MCR p14,0,<Rt>,c0,c6,2 ; Write Rt to DBGOSECCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.22 DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

**Purpose**

Provides a lock for the debug registers. The OS lock also disables some Software debug events.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDOSA==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.

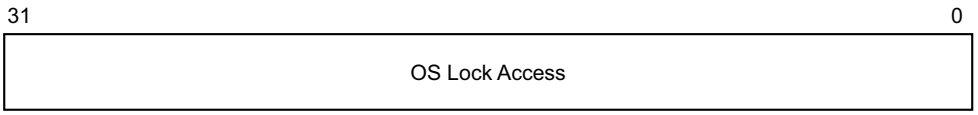
If MDCR_EL2.TDOSA==1, Non-secure EL1 write accesses to this register are trapped to EL2 using AArch64.

If MDCR_EL3.TDOSA==1, PL1 and PL2 write accesses to this register are trapped to EL3 using AArch64.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSLAR is architecturally mapped to AArch64 System register OSLAR_EL1.



AArch32 System register DBGOSLAR is architecturally mapped to External register OSLAR_EL1.

**Attributes**

DBGOSLAR is a 32-bit register.

#### Field descriptions

The DBGOSLAR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

OS Lock Access. Writing the value `0xC5ACCE55` to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use DBGOSLSR.OSLK to check the current status of the lock.

### Accessing the DBGOSLAR:

To access the DBGOSLAR:

```
MCR p14,0,<Rt>,c1,c0,4 ; Write Rt to DBGOSLAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0001 | 0000 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.23 DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

**Purpose**

Provides status information for the OS lock.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDOSA==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

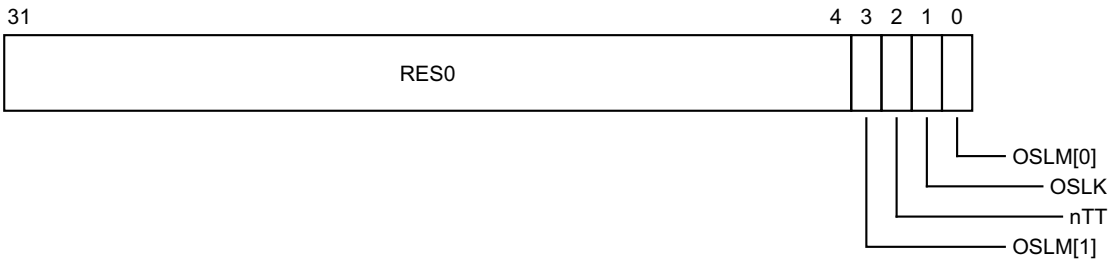
If MDCR_EL2.TDOSA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDOSA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSLSR is architecturally mapped to AArch64 System register OSLSR_EL1.



The OS lock status is also visible in the external debug interface through EDPRSR.

**Attributes**

DBGOSLSR is a 32-bit register.

#### Field descriptions

The DBGOSLSR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:4]**

Reserved, RES0.

**OSLM[1], bit [3]**

See below for description of the OSLM field.

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status. The possible values are:

0 OS lock unlocked.

1 OS lock locked.

The OS lock is locked and unlocked by writing to the OS Lock Access Register.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on Cold reset.

**OSLM[0], bit [0]**

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented. In ARMv8 these bits are as follows:

10 OS lock implemented. DBGOSSRR not implemented.

All other values are reserved.

### Accessing the DBGOSLSR:

To access the DBGOSLSR:

```
MRC p14,0,<Rt>,c1,c1,4 ; Read DBGOSLSR into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0001 | 0001 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.24 DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDOSA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDOSA==1, Non-secure EL1 accesses to this register are trapped to EL2.

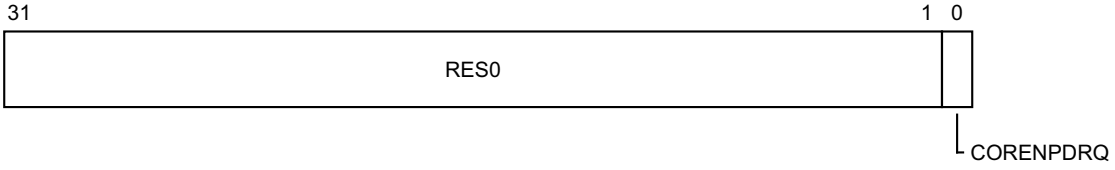
If MDCR_EL3.TDOSA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGPRCR is architecturally mapped to AArch64 System register DBGPRCR_EL1.

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.



The other bits in these registers are not mapped to each other.

**Attributes**

DBGPRCR is a 32-bit register.

#### Field descriptions

The DBGPRCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:1]**

Reserved, RES0.

**CORENPDRQ, bit [0]**

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

0 On a powerdown request, the system powers down the Core power domain.

1 On a powerdown request, the system emulates powerdown of the Core power domain. In this emulation mode the Core power domain is not actually powered down.

Writes to this bit are permitted regardless of the state of the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request Core no powerdown regardless of whether invasive debug is permitted.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, this field resets to the value of EDPRCR.COREPURQ.

This field resets to its defined reset value on Cold reset.

## Accessing the DBGPRCR:

To access the DBGPRCR:

```
MRC p14,0,<Rt>,c1,c4,4 ; Read DBGPRCR into Rt
MCR p14,0,<Rt>,c1,c4,4 ; Write Rt to DBGPRCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0001 | 0100 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

**Purpose**

Controls Vector catch debug events.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

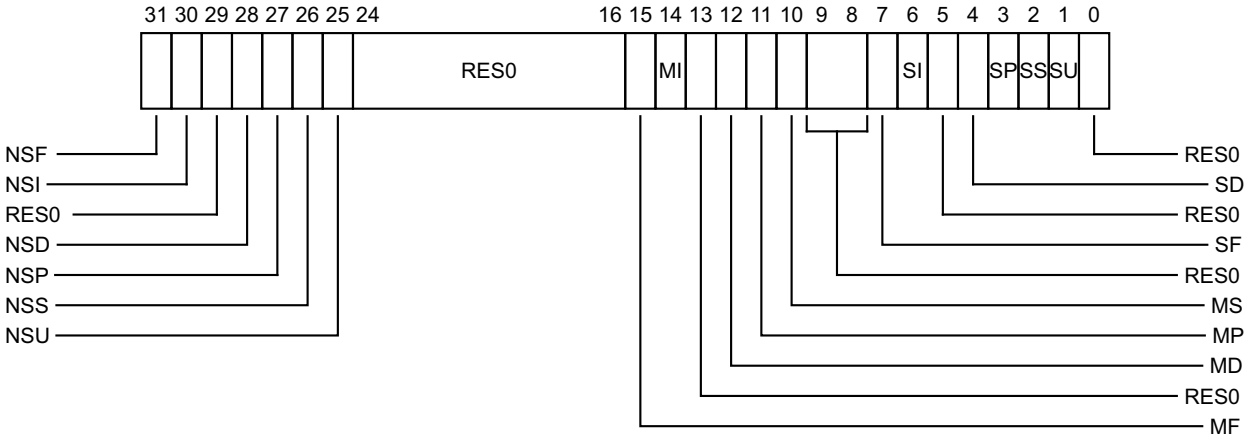
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGVCR is architecturally mapped to AArch64 System register DBGVCR32_EL2.

This register is required in all implementations.

**Attributes**



DBGVCR is a 32-bit register.

#### Field descriptions

The DBGVCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

***When EL3 implemented and using AArch32:***

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [24:16]**

Reserved, RES0.

**MF, bit [15]**

FIQ vector catch enable in Monitor mode.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**MI, bit [14]**

IRQ vector catch enable in Monitor mode.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [13]**

Reserved, RES0.

**MD, bit [12]**

Data Abort vector catch enable in Monitor mode.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**MP, bit [11]**

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [9:8]**

Reserved, RES0.

**SF, bit [7]**

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SI, bit [6]**

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

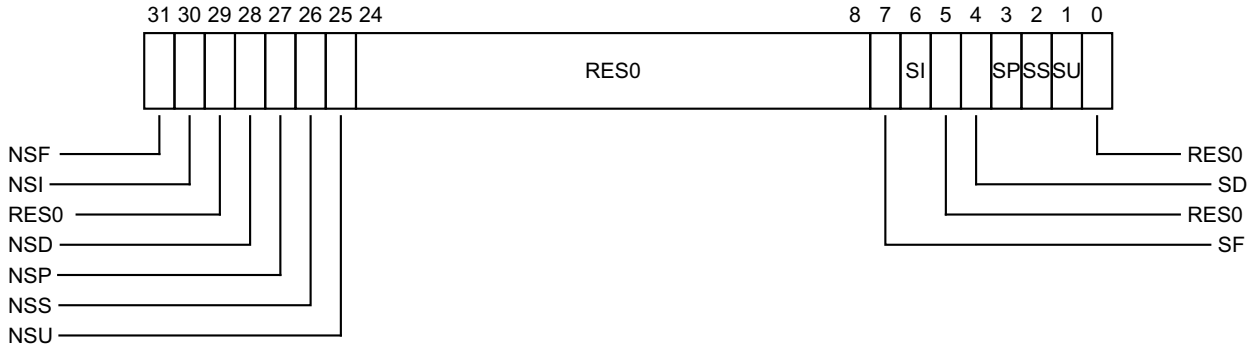
This field resets to its defined reset value on Warm reset.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.



This field resets to its defined reset value on Warm reset.

**Bit [0]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

***When EL3 implemented and using AArch64:***

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Non-Confidential - Beta

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [24:8]**

Reserved, RES0.

**SF, bit [7]**

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SI, bit [6]**

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

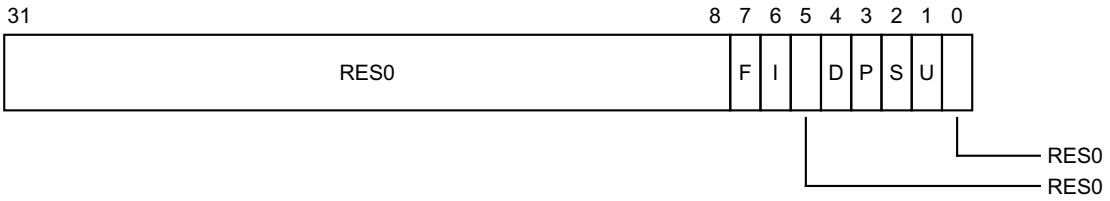
This field resets to its defined reset value on Warm reset.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [0]**

Reserved, RES0.

***When EL3 not implemented:***

**Bits [31:8]**

Reserved, RES0.

**F, bit [7]**

FIQ vector catch enable.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**I, bit [6]**

IRQ vector catch enable.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [5]**

Reserved, RES0.

**D, bit [4]**

Data Abort vector catch enable.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**P, bit [3]**

Prefetch Abort vector catch enable.

The exception vector offset `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**S, bit [2]**

Supervisor Call (SVC) vector catch enable.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**U, bit [1]**

Undefined Instruction vector catch enable.

The exception vector offset is `0x04`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [0]**

Reserved, RES0.

## Accessing the DBGVCR:

To access the DBGVCR:

```
MRC p14,0,<Rt>,c0,c7,0 ; Read DBGVCR into Rt
MCR p14,0,<Rt>,c0,c7,0 ; Write Rt to DBGVCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0111 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.26 DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

When the E field is zero, all the other fields in the register are ignored.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state.
- *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.
- *Software Access debug event* on page H3-4881 for accesses to this register taken to Debug state.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1 and EL2 accesses to this register generate a Software Access debug event.

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

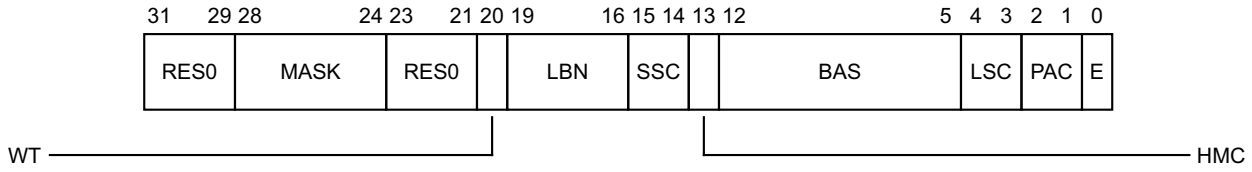
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGWCR<n> is architecturally mapped to AArch64 System register DBGWCR<n>_EL1.

AArch32 System register DBGWCR<n> is architecturally mapped to External register DBGWCR<n>_EL1.

If breakpoint n is not implemented then this register is unallocated.



**Attributes**

DBGWCR<n> is a 32-bit register.

#### Field descriptions

The DBGWCR<n> bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

`00000` No mask.

`00001` Reserved.

`00010` Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from `0b00011` masking 3 address bits (`0x00000007` mask for address) to `0b11111` masking 31 address bits (`0x7FFFFFFF` mask for address).

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

`0` Unlinked data address match.

`1` Linked data address match.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field resets to its defined reset value on Cold reset.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n> is being watched.

| BAS | Description |
|---|---|
| xxxxxxx1 | Match byte at DBGWVR<n> |
| xxxxxx1x | Match byte at DBGWVR<n>+1 |
| xxxxx1xx | Match byte at DBGWVR<n>+2 |
| xxxx1xxx | Match byte at DBGWVR<n>+3 |

In cases where DBGWVR<n> addresses a double-word:

| BAS | Description, if DBGWVR<n>[2] == 0 |
|---|---|
| xxx1xxxx | Match byte at DBGWVR<n>+4 |
| xx1xxxxx | Match byte at DBGWVR<n>+5 |
| x1xxxxxx | Match byte at DBGWVR<n>+6 |
| 1xxxxxxx | Match byte at DBGWVR<n>+7 |

If DBGWVR<n>[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. ARM deprecates setting DBGWVR<n>[2] == 1.

The valid values for BAS are `0b0000000`, or a binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software.

If BAS is zero, no bytes are watched by this watchpoint.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

`01` Match instructions that load from a watchpointed address.

`10` Match instructions that store to a watchpointed address.

`11` Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**E, bit [0]**

Enable watchpoint n. Possible values are:

`0` Watchpoint disabled.

`1` Watchpoint enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGWCR<n>:

To access the DBGWCR<n>:

```
MRC p14,0,<Rt>,c0,<CRm>,7 ; Read DBGWCR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,7 ; Write Rt to DBGWCR<n>, where n is in the range 0 to 15
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | n<3:0> | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.27 DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

**Purpose**

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

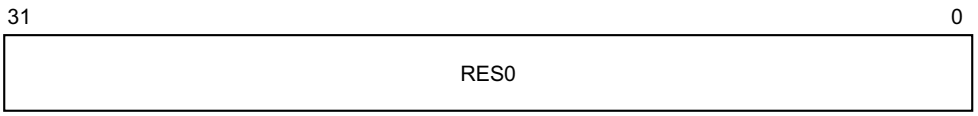
Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**



There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

DBGWFAR is a 32-bit register.

#### Field descriptions

The DBGWFAR bit assignments are:

**Bits [31:0]**

Reserved, RES0.

#### Accessing the DBGWFAR:

To access the DBGWFAR:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p14,0,<Rt>,c0,c6,0 ; Read DBGWFAR into Rt
MCR p14,0,<Rt>,c0,c6,0 ; Write Rt to DBGWFAR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | 0110 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.28 DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state.
- *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.
- *Software Access debug event* on page H3-4881 for accesses to this register taken to Debug state.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1 and EL2 accesses to this register generate a Software Access debug event.

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

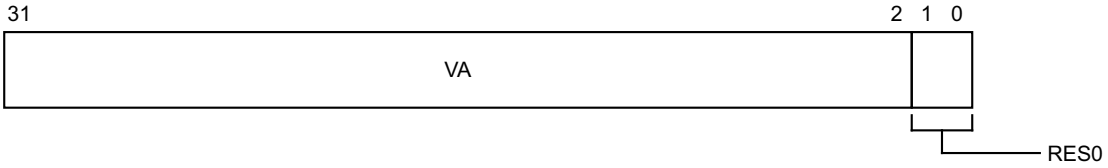
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGWVR<n> is architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].

AArch32 System register DBGWVR<n> is architecturally mapped to External register DBGWVR<n>_EL1[31:0].

If breakpoint n is not implemented then this register is unallocated.



**Attributes**

DBGWVR<n> is a 32-bit register.

#### Field descriptions

The DBGWVR<n> bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**VA, bits [31:2]**

Bits[31:2] of the address value for comparison.

ARM deprecates setting DBGWVR<n>[2] == 1.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [1:0]**

Reserved, RES0.

## Accessing the DBGWVR<n>:

To access the DBGWVR<n>:

```
MRC p14,0,<Rt>,c0,<CRm>,6 ; Read DBGWVR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,6 ; Write Rt to DBGWVR<n>, where n is in the range 0 to 15
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1110 | 000 | 0000 | n<3:0> | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.29 DLR, Debug Link Register

The DLR characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| RW | RW | RW |

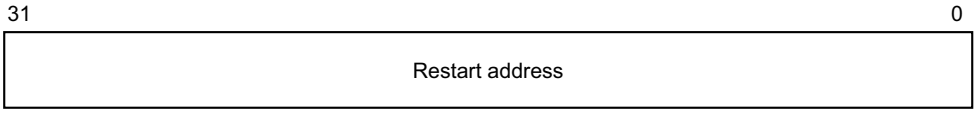
Access to this register is from Debug state only. During normal execution this register is unallocated.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register DLR is architecturally mapped to AArch64 System register DLR_EL0[31:0].

**Attributes**

DLR is a 32-bit register.

#### Field descriptions

The DLR bit assignments are:

**Bits [31:0]**

Restart address.

#### Accessing the DLR:

To access the DLR:

```
MRC p15,3,<Rt>,c4,c5,1 ; Read DLR into Rt
MCR p15,3,<Rt>,c4,c5,1 ; Write Rt to DLR
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 011 | 0100 | 0101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

**Purpose**

Holds the saved process state on entry to Debug state.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| RW | RW | RW |

Access to this register is from Debug state only. During normal execution this register is unallocated.

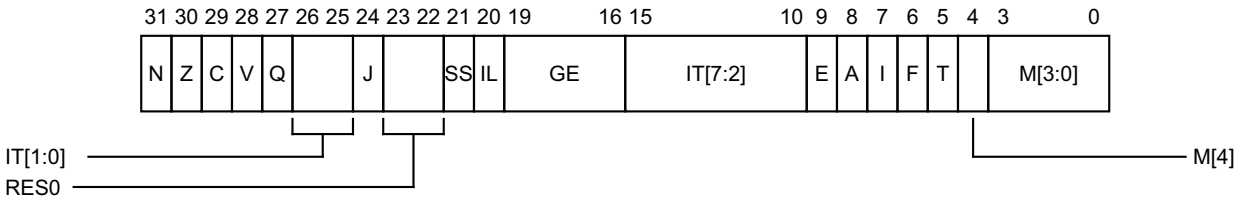
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DSPSR is architecturally mapped to AArch64 System register DSPSR_EL0.



**Attributes**

DSPSR is a 32-bit register.

## Field descriptions

The DSPSR bit assignments are:

***When entering Debug state from AArch32 and exiting Debug state to AArch32:***

**N, bit [31]**

Set to the value of CPSR.N on entering Debug state, and copied to CPSR.N on exiting Debug state.

**Z, bit [30]**

Set to the value of CPSR.Z on entering Debug state, and copied to CPSR.Z on exiting Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [29]**

Set to the value of CPSR.C on entering Debug state, and copied to CPSR.C on exiting Debug state.

**V, bit [28]**

Set to the value of CPSR.V on entering Debug state, and copied to CPSR.V on exiting Debug state.

**Q, bit [27]**

Set to the value of CPSR.Q on entering Debug state, and copied to CPSR.Q on exiting Debug state.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from. Possible values of this bit are:

0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that Debug state was entered from. Possible values of this bit are:

1 Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that Debug state was entered from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32) |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

## Accessing the DSPSR:

To access the DSPSR:

```
MRC p15,3,<Rt>,c4,c5,0 ; Read DSPSR into Rt
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MCR p15,3,<Rt>,c4,c5,0 ; Write Rt to DSPSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 011 | 0100 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.31 HDCR, Hyp Debug Control Register

The HDCR characteristics are:

**Purpose**

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors extension.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

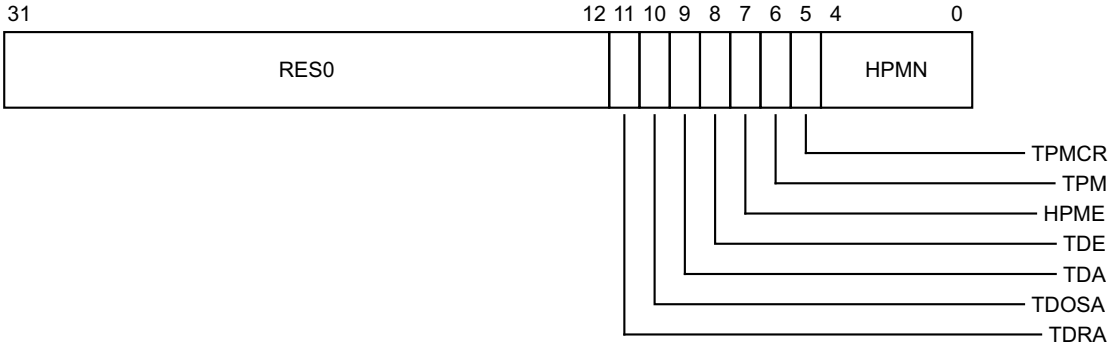
If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL2 accesses to this register are trapped to EL3 using AArch64.

**Configurations**

AArch32 System register HDCR is architecturally mapped to AArch64 System register MDCR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



**Attributes**

HDCR is a 32-bit register.

#### Field descriptions

The HDCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:12]**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 CP14 accesses to the Debug ROM registers to Hyp mode.

`0` Non-secure EL0 and EL1 CP14 accesses to the Debug ROM registers are not trapped to Hyp mode.

`1` Non-secure EL0 and EL1 CP14 accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**TDOSA, bit [10]**

Trap debug OS-related register access. Traps Non-secure EL1 CP14 accesses to the powerdown debug registers to Hyp mode.

`0` Non-secure EL1 CP14 accesses to the powerdown debug registers are not trapped to Hyp mode.

`1` Non-secure EL1 CP14 accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, DBGOSDLR, and the DBGPRCR.
- Any IMPLEMENTATION DEFINED integration registers.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

**Note**

These registers are not accessible at PL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TDA, bit [9]**

Trap debug access. Traps Non-secure EL0 and EL1 CP14 accesses to those CP14 registers that are not trapped by either of the following:

- HDCR.TDRA.
- HDCR.TDOSA.

`0` Has no effect on CP14 accesses to the debug registers.

`1` Non-secure EL0 or EL1 CP14 accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode.

HDCR.TDA does not trap accesses to the DBGDTRRXint or DBGDTRTXint when the PE is in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**TDE, bit [8]**

Trap Debug exceptions. The possible values of this bit are:

`0` Has no effect on Debug exceptions.

`1` Route Non-secure Debug exceptions to Hyp mode.

If HCR.TGE == 1, then this bit is ignored and treated as though it is 1 other than for the value read back from HDCR.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**HPME, bit [7]**

Hypervisor Performance Monitors Enable. The possible values of this bit are:

`0` Hyp mode Performance Monitors disabled.

`1` Hyp mode Performance Monitors enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from Hyp mode or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TPM, bit [6]**

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

`0` Non-secure EL0 and EL1 accesses to all Performance Monitors registers are not trapped to Hyp mode.

`1` Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

**Note**

- EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field resets to its defined reset value on Warm reset.

**TPMCR, bit [5]**

Trap PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR to Hyp mode.

0 Non-secure EL0 and EL1 accesses to the PMCR are not trapped to Hyp mode.

1 Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode.

**Note**

- EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

This field resets to its defined reset value on Warm reset.

**HPMN, bits [4:0]**

Defines the number of Performance Monitors counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If the Performance Monitors extension is not implemented, this field is RES0.

In Non-secure state, HPMN divides the Performance Monitors counters as follows. If software is accessing Performance Monitors counter n then, in Non-secure state:

- If n is in the range 0<=n<HPMN, the counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled. PMCR.E enables the operation of counters in this range.
- If n is in the range HPMN<=n<PMCR.N, the counter is accessible only from EL2. HDCR.HPME enables the operation of counters in this range.

If this field is set to 0, or to a value larger than PMCR.N, then the following CONSTRAINED UNPREDICTABLE behavior applies:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an UNKNOWN non-zero value less than PMCR.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an architecturally UNKNOWN value.

This field resets to its defined reset value on Warm reset.

## Accessing the HDCR:

To access the HDCR:

```
MRC p15,4,<Rt>,c1,c1,1 ; Read HDCR into Rt
MCR p15,4,<Rt>,c1,c1,1 ; Write Rt to HDCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 0001 | 0001 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.32 SDCR, Secure Debug Configuration Register

The SDCR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, controls debug and performance monitors functionality in Secure state.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|---|
| - | - | - | RW | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

If EL3 is implemented and is using AArch64, any read or write to SDCR from Secure EL1 using AArch32 is trapped as an exception to EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

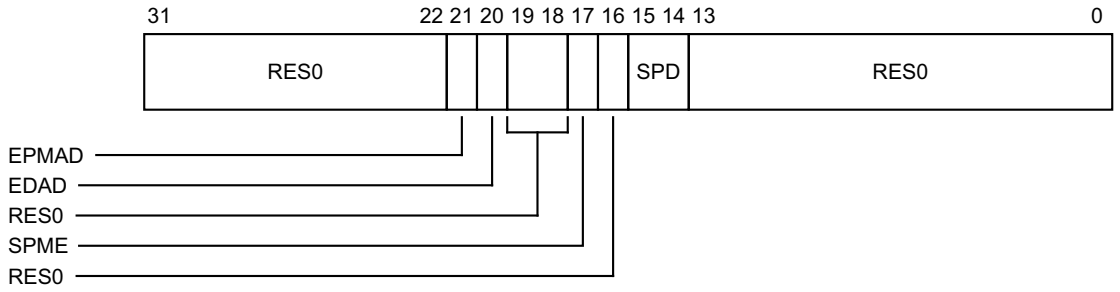
If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register SDCR can be mapped to AArch64 System register MDCR_EL3, but this is not architecturally mandated.



**Attributes**

SDCR is a 32-bit register.

#### Field descriptions

The SDCR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:22]**

Reserved, RES0.

**EPMAD, bit [21]**

External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger:

0 Access to Performance Monitors registers from external debugger is permitted.

1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors extension is not implemented or does not support external debug interface accesses this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

This field resets to its defined reset value on Warm reset.

**EDAD, bit [20]**

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger:

0 Access to breakpoint and watchpoint registers from external debugger is permitted.

1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**Bits [19:18]**

Reserved, RES0.

**SPME, bit [17]**

Secure Performance Monitors enable. This allows event counting in Secure state:

0 Event counting prohibited in Secure state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

1 Event counting allowed in Secure state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**Bit [16]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SPD, bits [15:14]**

AArch32 Secure privileged debug. Enables or disables debug exceptions from Secure state, other than Software breakpoint instructions. Valid values for this field are:

`00` Legacy mode. Debug exceptions from Secure EL1 are enabled by the authentication interface.

`10` Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.

`11` Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as `0b00`. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if SDER32_EL3.SUIDEN == 1.

Ignored in Non-secure state. Debug exceptions from Software breakpoint instruction debug events are always enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**Bits [13:0]**

Reserved, RES0.

## Accessing the SDCR:

To access the SDCR:

```
MRC p15,0,<Rt>,c1,c3,1 ; Read SDCR into Rt
MCR p15,0,<Rt>,c1,c3,1 ; Write Rt to SDCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.3.33 SDER, Secure Debug Enable Register

The SDER characteristics are:

**Purpose**

Controls invasive and non-invasive debug in the Secure EL0 mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | - |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

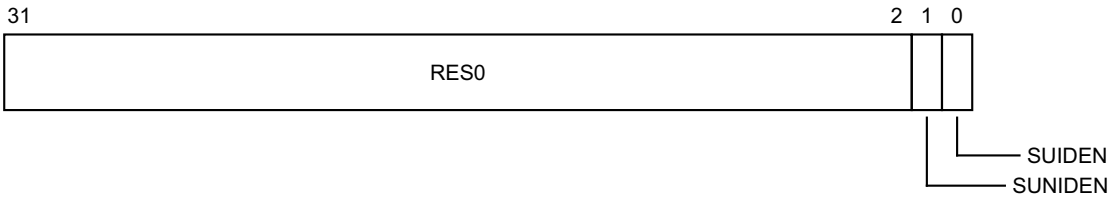
If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register SDER is architecturally mapped to AArch64 System register SDER32_EL3.



If EL3 is not implemented and EL1 supports AArch32, SDER is implemented only if the implemented Security state is Secure state.

**Attributes**

SDER is a 32-bit register.

#### Field descriptions

The SDER bit assignments are:

**Bits [31:2]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SUNIDEN, bit [1]**

Secure User Non-Invasive Debug Enable:

0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by MDCR_EL3.SPME, SDCR.SPME, or the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

1 Performance Monitors event counting allowed in Secure EL0.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**SUIDEN, bit [0]**

Secure User Invasive Debug Enable:

0 Debug exceptions other than Software Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by MDCR_EL3.SPD32 or SDCR.SPD.

1 Debug exceptions from Secure EL0 are enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

## Accessing the SDER:

To access the SDER:

```
MRC p15,0,<Rt>,c1,c1,1 ; Read SDER into Rt
MCR p15,0,<Rt>,c1,c1,1 ; Write Rt to SDER
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 0001 | 0001 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR.SEL set to `0b11111`.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

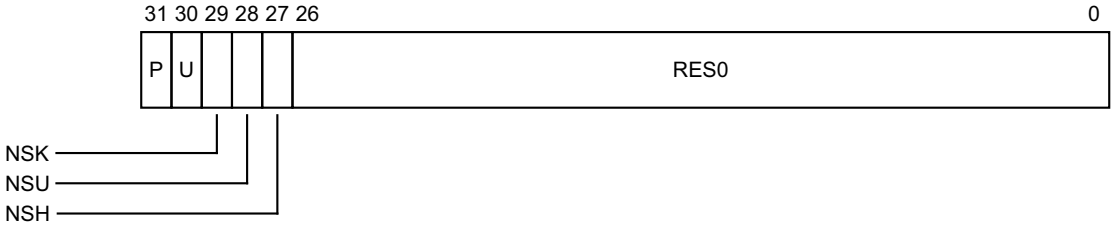
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCCFILTR is architecturally mapped to AArch64 System register PMCCFILTR_EL0.

AArch32 System register PMCCFILTR is architecturally mapped to External register PMCCFILTR_EL0.

Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMCCFILTR is a 32-bit register.

#### Field descriptions

The PMCCFILTR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

`0` Count cycles in EL1.

`1` Do not count cycles in EL1.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

`0` Count cycles in EL0.

`1` Do not count cycles in EL0.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to `0`.

This field resets to its defined reset value on Warm reset.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to `0`.

This field resets to its defined reset value on Warm reset.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

`0` Do not count cycles in EL2.

`1` Count cycles in EL2.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field resets to its defined reset value on Warm reset.

**Bits [26:0]**

Reserved, RES0.

### Accessing the PMCCFILTR:

To access the PMCCFILTR:

```
MRC p15,0,<Rt>,c14,c15,7 ; Read PMCCFILTR into Rt
MCR p15,0,<Rt>,c14,c15,7 ; Write Rt to PMCCFILTR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 1111 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D5-1858 for more information.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

The PMCR.{LC, D} bits configure whether PMCCNTR increments every clock cycle, or once every 64 clock cycles.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.CR==0, and PMUSERENR.EN==0, PL0 read accesses to this register are trapped to Undefined mode.

If PMUSERENR.EN==0, PL0 write accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.CR==0, and PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

If PMUSERENR_EL0.EN==0, PL0 write accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

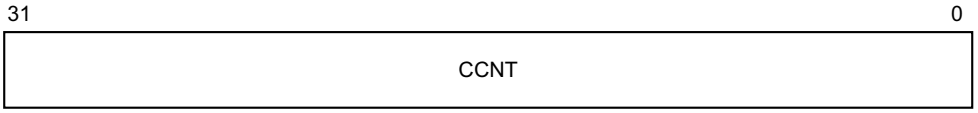
AArch32 System register PMCCNTR is architecturally mapped to AArch64 System register PMCCNTR_EL0.

AArch32 System register PMCCNTR is architecturally mapped to External register PMCCNTR_EL0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



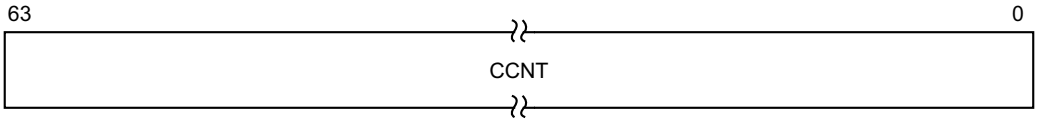
**Attributes**

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

## Field descriptions

The PMCCNTR bit assignments are:

***When accessing as a 32-bit register:***



**CCNT, bits [31:0]**

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

***When accessing as a 64-bit register:***

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

## Accessing the PMCCNTR:

To access the PMCCNTR when accessing as a 32-bit register:

```
MRC p15,0,<Rt>,c9,c13,0 ; Read PMCCNTR[31:0] into Rt
MCR p15,0,<Rt>,c9,c13,0 ; Write Rt to PMCCNTR[31:0]. PMCCNTR[63:32] are unchanged
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

To access the PMCCNTR when accessing as a 64-bit register:

```
MRRC p15,0,<Rt>,<Rt2>,c9 ; Read PMCCNTR[31:0] into Rt and PMCCNTR[63:32] into Rt2
MCRR p15,0,<Rt>,<Rt2>,c9 ; Write Rt to PMCCNTR[31:0] and Rt2 to PMCCNTR[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0000 | 1001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 read accesses to this register are trapped to Undefined mode.

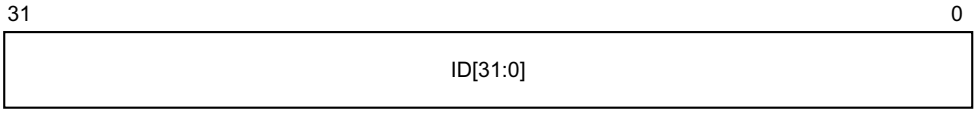
If PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCEID0 is architecturally mapped to AArch64 System register PMCEID0_EL0.

AArch32 System register PMCEID0 is architecturally mapped to External register PMCEID0_EL0.



**Attributes**

PMCEID0 is a 32-bit register.

#### Field descriptions

The PMCEID0 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**ID[31:0], bits [31:0]**

PMCEID0[n] maps to event n. For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1872.

For each bit:

`0` The common event is not implemented.

`1` The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

## Accessing the PMCEID0:

To access the PMCEID0:

```
MRC p15,0,<Rt>,c9,c12,6 ; Read PMCEID0 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.4 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 read accesses to this register are trapped to Undefined mode.

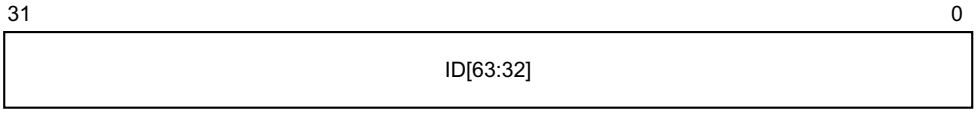
If PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCEID1 is architecturally mapped to AArch64 System register PMCEID1_EL0.

AArch32 System register PMCEID1 is architecturally mapped to External register PMCEID1_EL0.



**Attributes**

PMCEID1 is a 32-bit register.

#### Field descriptions

The PMCEID1 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**ID[63:32], bits [31:0]**

PMCEID1[n] maps to event (n + 32). For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1872.

For each bit:

`0` The common event is not implemented.

`1` The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

## Accessing the PMCEID1:

To access the PMCEID1:

```
MRC p15,0,<Rt>,c9,c12,7 ; Read PMCEID1 into Rt
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.5 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMCNTENCLR. See the description of the Px bit.

PMCNTENCLR is used in conjunction with the PMCNTENSET register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

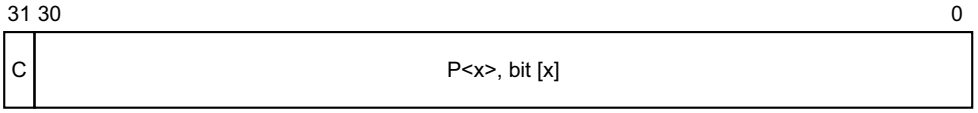
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCNTENCLR is architecturally mapped to AArch64 System register PMCNTENCLR_EL0.

AArch32 System register PMCNTENCLR is architecturally mapped to External register PMCNTENCLR_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMCNTENCLR is a 32-bit register.

#### Field descriptions

The PMCNTENCLR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [31]**

PMCCNTR disable bit. Disables the cycle counter register. Possible values are:

`0` When read, means the cycle counter is disabled. When written, has no effect.

`1` When read, means the cycle counter is enabled. When written, disables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**

Event counter disable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Possible values of each bit are:

`0` When read, means that PMEVCNTR<x> is disabled. When written, has no effect.

`1` When read, means that PMEVCNTR<x> is enabled. When written, disables PMEVCNTR<x>.

## Accessing the PMCNTENCLR:

To access the PMCNTENCLR:

```
MRC p15,0,<Rt>,c9,c12,2 ; Read PMCNTENCLR into Rt
MCR p15,0,<Rt>,c9,c12,2 ; Write Rt to PMCNTENCLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.6 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMCNTENSET. See the description of the Px bit.

PMCNTENSET is used in conjunction with the PMCNTENCLR register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

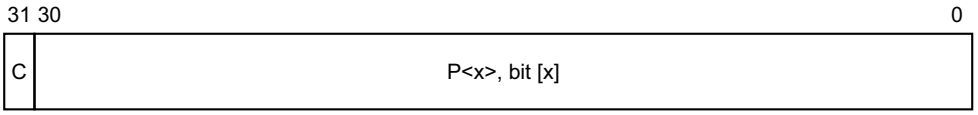
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCNTENSET is architecturally mapped to AArch64 System register PMCNTENSET_EL0.

AArch32 System register PMCNTENSET is architecturally mapped to External register PMCNTENSET_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMCNTENSET is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## Field descriptions

The PMCNTENSET bit assignments are:

**C, bit [31]**

PMCCNTR enable bit. Enables the cycle counter register. Possible values are:

`0` When read, means the cycle counter is disabled. When written, has no effect.

`1` When read, means the cycle counter is enabled. When written, enables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**

Event counter enable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Possible values of each bit are:

`0` When read, means that PMEVCNTR<x> is disabled. When written, has no effect.

`1` When read, means that PMEVCNTR<x> event counter is enabled. When written, enables PMEVCNTR<x>.

## Accessing the PMCNTENSET:

To access the PMCNTENSET:

```
MRC p15,0,<Rt>,c9,c12,1 ; Read PMCNTENSET into Rt
MCR p15,0,<Rt>,c9,c12,1 ; Write Rt to PMCNTENSET
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.7 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HDCR.TPMCR==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPMCR==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

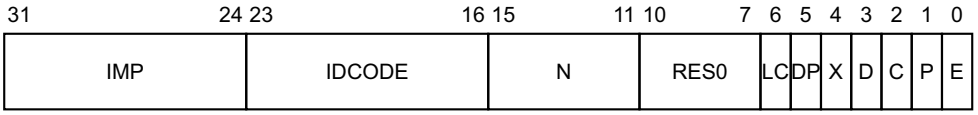
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCR is architecturally mapped to AArch64 System register PMCR_EL0.

AArch32 System register PMCR[6:0] is architecturally mapped to External register PMCR_EL0[6:0].

Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMCR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMCR bit assignments are:

**IMP, bits [31:24]**

Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.

The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the MIDR.

**IDCODE, bits [23:16]**

Identification code. This field is RO with an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

**N, bits [15:11]**

Number of event counters. A RO field that indicates the number counters implemented. The value of this field is the number of counters implemented, from `0b00000` for no counters to `0b11111` for 31 counters.

In an implementation that includes EL2, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of HDCR.HPMN.

An implementation can implement only the Cycle Count Register, PMCCNTR. This is indicated by a value of `0b00000` for the N field.

**Bits [10:7]**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines which PMCCNTR bit generates an overflow recorded by PMOVSR[31].

`0` Cycle counter overflow on increment that changes PMCCNTR[31] from 1 to 0.

`1` Cycle counter overflow on increment that changes PMCCNTR[63] from 1 to 0.

ARM deprecates use of PMCR.LC = 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**DP, bit [5]**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

`0` PMCCNTR, if enabled, counts when event counting is prohibited.

`1` PMCCNTR does not count when event counting is prohibited.

Event counting is prohibited when ProfilingProhibited(IsSecure(),PSTATE.EL) == TRUE.

This bit is RW.

If EL3 is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to `0`.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**X, bit [4]**

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

0 Do not export events.

1 Export events where not prohibited.

This bit is used to permit events to be exported to another debug device, such as an OPTIONAL trace macrocell, over an event bus. If the implementation does not include such an event bus, this bit is RAZ/WI.

This bit does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If the implementation does not include an exported event stream, this bit is RAZ/WI. Otherwise this bit is RW.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

This field resets to its defined reset value on Warm reset.

**D, bit [3]**

Clock divider. The possible values of this bit are:

0 When enabled, PMCCNTR counts every clock cycle.

1 When enabled, PMCCNTR counts once every 64 clock cycles.

This bit is RW.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of PMCR.D = 1.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**C, bit [2]**

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

0 No action.

1 Reset PMCCNTR to zero.

This bit is always RAZ.

Resetting PMCCNTR does not clear the PMCCNTR overflow bit to 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**P, bit [1]**

Event counter reset. This bit is WO. The effects of writing to this bit are:

0 No action.

1 Reset all event counters accessible in the current EL, not including PMCCNTR, to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that HDCR.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**E, bit [0]**

Enable. The possible values of this bit are:

`0` All counters, including PMCCNTR, are disabled.

`1` All counters are enabled by PMCNTENSET.

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that HDCR.HPMN reserves for EL2 use.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

### Accessing the PMCR:

To access the PMCR:

```
MRC p15,0,<Rt>,c9,c12,0 ; Read PMCR into Rt
MCR p15,0,<Rt>,c9,c12,0 ; Write Rt to PMCR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.8 PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

This register can be read at EL0 when PMUSERENR.EN or PMUSERENR.ER is set to 1, and can be written at EL0 when PMUSERENR.ER is set to 1.

PMEVCNTR<n> can also be accessed by using PMXEVCNTR with PMSELR.SEL set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR.SEL, or PMSELR_EL0.SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If PMUSERENR.EN==0, and PMUSERENR.ER==0, PL0 read accesses to this register are trapped to Undefined mode.

If PMUSERENR.EN==0, PL0 write accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 write accesses to this register are trapped to EL1.

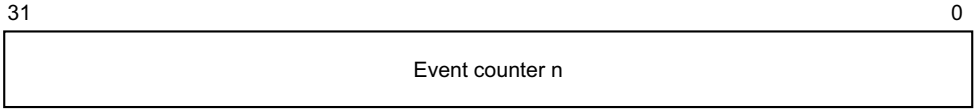
If PMUSERENR_EL0.ER==0, and PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMEVCNTR<n> is architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0.

AArch32 System register PMEVCNTR<n> is architecturally mapped to External register PMEVCNTR<n>_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVCNTR<n> is a 32-bit register.

## Field descriptions

The PMEVCNTR<n> bit assignments are:

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

## Accessing the PMEVCNTR<n>:

To access the PMEVCNTR<n>:

```
MRC p15,0,<Rt>,c14,<CRm>,<opc2> ; Read PMEVCNTR<n> into Rt, where n is in the range 0 to 30
MCR p15,0,<Rt>,c14,<CRm>,<opc2> ; Write Rt to PMEVCNTR<n>, where n is in the range 0 to 30
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 10:n<4:3> | n<2:0> |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.9 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

This register is accessible at EL0 when PMUSERENR.EN is set to 1.

PMEVTYPER<n> can also be accessed by using PMXEVTYPER with PMSELR.SEL set to n.

If <n> is greater or equal to the number of accessible counters, reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR.SEL, or PMSELR_EL0.SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

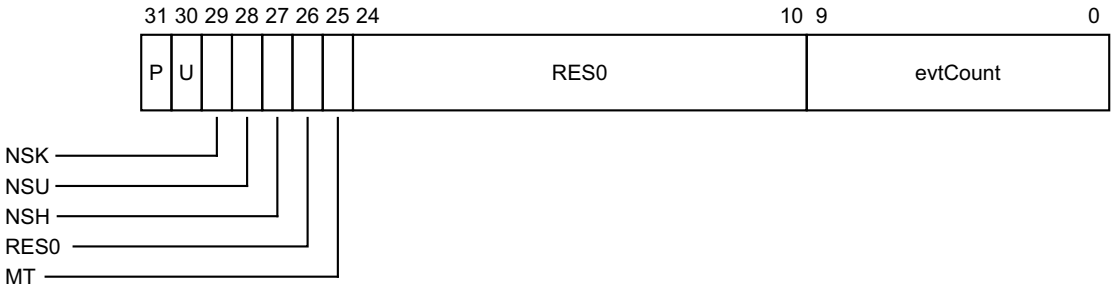
If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMEVTYPER<n> is architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0.

AArch32 System register PMEVTYPER<n> is architecturally mapped to External register PMEVTYPER<n>_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVTYPER<n> is a 32-bit register.

## Field descriptions

The PMEVTYPER<n> bit assignments are:

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

`0` Count events in EL1.

`1` Do not count events in EL1.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

`0` Count events in EL0.

`1` Do not count events in EL0.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0 Do not count events in EL2.

1 Count events in EL2.

**Bit [26]**

Reserved, RES0.

**MT, bit [25]**

Multi-threading. If MPIDR_EL1.MT is set to 0, this bit is RES0. Otherwise valid values for this bit are:

0 Count events only on controlling PE.

1 Count events from any PE with the same affinity at level 1 and above as this PE.

**Note**

Events from a different thread of a multi-threaded implementation are not Attributable to the thread counting the event.

**Bits [24:10]**

Reserved, RES0.

**evtCount, bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>.

Software must program this field with an event defined by the processor or a common event defined by the architecture.

If evtCount is programmed to an event that is reserved or not implemented, the behavior depends on the event type.

For common architectural and microarchitectural events:

- No events are counted.
- The value read back on evtCount is the value written.

For IMPLEMENTATION DEFINED events:

- It is UNPREDICTABLE what event, if any, is counted. UNPREDICTABLE in this case means the event must not expose privileged information.
- The value read back on evtCount is an UNKNOWN value with the same effect.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

### Accessing the PMEVTYPER<n>:

To access the PMEVTYPER<n>:

```
MRC p15,0,<Rt>,c14,<CRm>,<opc2> ; Read PMEVTYPER<n> into Rt, where n is in the range 0 to 30
MCR p15,0,<Rt>,c14,<CRm>,<opc2> ; Write Rt to PMEVTYPER<n>, where n is in the range 0 to 30
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 11:n<4:3> | n<2:0> |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.10 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMINTENCLR. See the description of the P<x> bit.

PMINTENCLR is used in conjunction with the PMINTENSET register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL1 and PL2 accesses to this register are trapped to EL3.

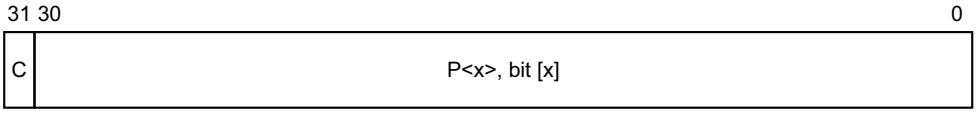
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMINTENCLR is architecturally mapped to AArch64 System register PMINTENCLR_EL1.

AArch32 System register PMINTENCLR is architecturally mapped to External register PMINTENCLR_EL1.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMINTENCLR is a 32-bit register.

#### Field descriptions

The PMINTENCLR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [31]**

PMCCNTR overflow interrupt request disable bit. Possible values are:

`0` When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

`1` When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<x>.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Bits [30:N] are RAZ/WI.

Possible values are:

`0` When read, means that the PMEVCNTR<x> event counter interrupt request is disabled. When written, has no effect.

`1` When read, means that the PMEVCNTR<x> event counter interrupt request is enabled. When written, disables the PMEVCNTR<x> interrupt request.

## Accessing the PMINTENCLR:

To access the PMINTENCLR:

```
MRC p15,0,<Rt>,c9,c14,2 ; Read PMINTENCLR into Rt
MCR p15,0,<Rt>,c9,c14,2 ; Write Rt to PMINTENCLR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.11 PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMINTENSET. See the description of the P<x> bit.

PMINTENSET is used in conjunction with the PMINTENCLR register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL1 and PL2 accesses to this register are trapped to EL3.

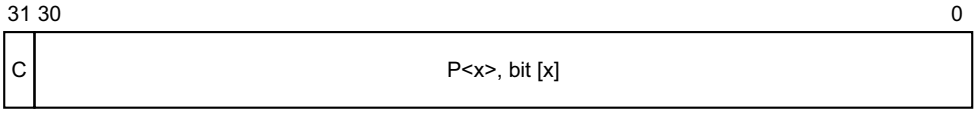
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMINTENSET is architecturally mapped to AArch64 System register PMINTENSET_EL1.

AArch32 System register PMINTENSET is architecturally mapped to External register PMINTENSET_EL1.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMINTENSET is a 32-bit register.

#### Field descriptions

The PMINTENSET bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [31]**

PMCCNTR overflow interrupt request enable bit. Possible values are:

`0` When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

`1` When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow interrupt request enable bit for PMEVCNTR<x>.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Bits [30:N] are RAZ/WI.

Possible values are:

`0` When read, means that the PMEVCNTR<x> event counter interrupt request is disabled. When written, has no effect.

`1` When read, means that the PMEVCNTR<x> event counter interrupt request is enabled. When written, enables the PMEVCNTR<x> interrupt request.

## Accessing the PMINTENSET:

To access the PMINTENSET:

```
MRC p15,0,<Rt>,c9,c14,1 ; Read PMINTENSET into Rt
MCR p15,0,<Rt>,c9,c14,1 ; Write Rt to PMINTENSET
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.12 PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<x>. Writing to this register clears these bits.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMOVSR. See the description of the Px bit.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

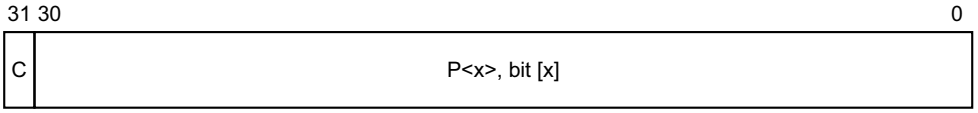
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMOVSR is architecturally mapped to AArch64 System register PMOVSCLR_EL0.

AArch32 System register PMOVSR is architecturally mapped to External register PMOVSCLR_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMOVSR is a 32-bit register.

#### Field descriptions

The PMOVSR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [31]**

PMCCNTR overflow bit. Possible values are:

0 When read, means the cycle counter has not overflowed. When written, has no effect.

1 When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR.LC is used to control from which bit of PMCCNTR (bit 31 or bit 63) an overflow is detected.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow clear bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Possible values of each bit are:

0 When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

1 When read, means that PMEVCNTR<x> has overflowed. When written, clears the PMEVCNTR<x> overflow bit to 0.

## Accessing the PMOVSR:

To access the PMOVSR:

```
MRC p15,0,<Rt>,c9,c12,3 ; Read PMOVSR into Rt
MCR p15,0,<Rt>,c9,c12,3 ; Write Rt to PMOVSR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.13 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<x>.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMOVSSET. See the description of the Px bit.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

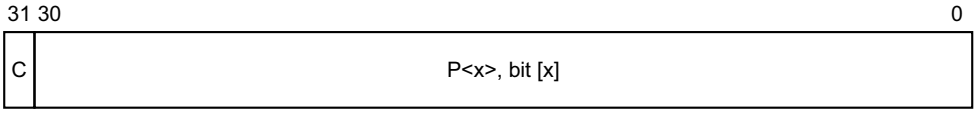
**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMOVSSET is architecturally mapped to AArch64 System register PMOVSSET_EL0.

AArch32 System register PMOVSSET is architecturally mapped to External register PMOVSSET_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMOVSSET is a 32-bit register.

#### Field descriptions

The PMOVSSET bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**C, bit [31]**

PMCCNTR overflow bit. Possible values are:

`0` When read, means the cycle counter has not overflowed. When written, has no effect.

`1` When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow set bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Possible values are:

`0` When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

`1` When read, means that PMEVCNTR<x> has overflowed. When written, sets the PMEVCNTR<x> overflow bit to 1.

## Accessing the PMOVSSET:

To access the PMOVSSET:

```
MRC p15,0,<Rt>,c9,c14,3 ; Read PMOVSSET into Rt
MCR p15,0,<Rt>,c9,c14,3 ; Write Rt to PMOVSSET
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1110 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.14 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<x> or the cycle counter, CCNT.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR, to determine the value of a selected event counter.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, and PMUSERENR.ER==0, PL0 accesses to this register are trapped to Undefined mode.

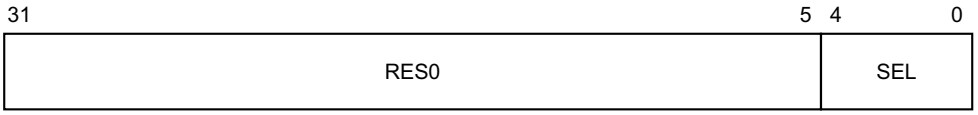
If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMSELR is architecturally mapped to AArch64 System register PMSELR_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMSELR is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMSELR bit assignments are:

**Bits [31:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, PMEVCNTR<x>, where x is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER or PMXEVCNTR occurs.

This field can take any value from 0 (`0b00000`) to (PMCR.N)-1, or 31 (`0b11111`).

When PMSELR.SEL is `0b11111` it selects the cycle counter and:

- A read of the PMXEVTYPER returns the value of PMCCFILTR.
- A write of the PMXEVTYPER writes to PMCCFILTR.
- A read or write of PMXEVCNTR has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
  - Access to PMXEVCNTR is UNDEFINED.
  - Access to PMXEVCNTR behaves as a NOP.
  - Access to PMXEVCNTR behaves as if the register is RAZ/WI.
  - Access to PMXEVCNTR behaves as if the PMSELR.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, the results of access to PMXEVTYPER or PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and can be one of the following:

- Access to PMXEVTYPER or PMXEVCNTR is UNDEFINED.
- Access to PMXEVTYPER or PMXEVCNTR behaves as a NOP.
- Access to PMXEVTYPER or PMXEVCNTR behaves as if the register is RAZ/WI.
- Access to PMXEVTYPER or PMXEVCNTR behaves as if the PMSELR.SEL field contains an UNKNOWN value.
- Access to PMXEVTYPER or PMXEVCNTR behaves as if the PMSELR.SEL field contains `0b11111`.

### Accessing the PMSELR:

To access the PMSELR:

```
MRC p15,0,<Rt>,c9,c12,5 ; Read PMSELR into Rt
MCR p15,0,<Rt>,c9,c12,5 ; Write Rt to PMSELR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.15 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event `0x00`.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | Config-WO | WO | WO | WO | WO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-WO | WO | WO |

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMSWINC. See the description of the Px bit.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 write accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 write accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 write accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 write accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 write accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, and PMUSERENR.SW==0, PL0 write accesses to this register are trapped to Undefined mode.

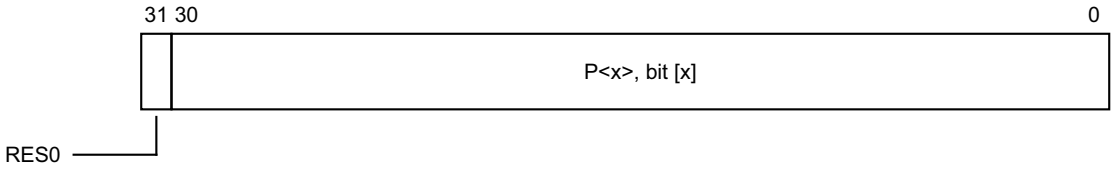
If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.SW==0, PL0 write accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMSWINC is architecturally mapped to AArch64 System register PMSWINC_EL0.

AArch32 System register PMSWINC is architecturally mapped to External register PMSWINC_EL0.



**Attributes**

PMSWINC is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMSWINC bit assignments are:

**Bit [31]**

Reserved, RES0.

**P<x>, bit [x], for x = 0 to 30**

Event counter software increment bit for PMEVCNTR<x>.

Bits [30:N] are WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

The effects of writing to this bit are:

0 No action. The write to this bit is ignored.

1 If PMEVCNTR<x> is enabled and configured to count the software increment event, increments PMEVCNTR<x> by 1. If PMEVCNTR<x> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

### Accessing the PMSWINC:

To access the PMSWINC:

```
MCR p15,0,<Rt>,c9,c12,4 ; Write Rt to PMSWINC
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1100 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.16 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

**Purpose**

Enables or disables User mode access to the Performance Monitors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RO | RO | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| RO | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

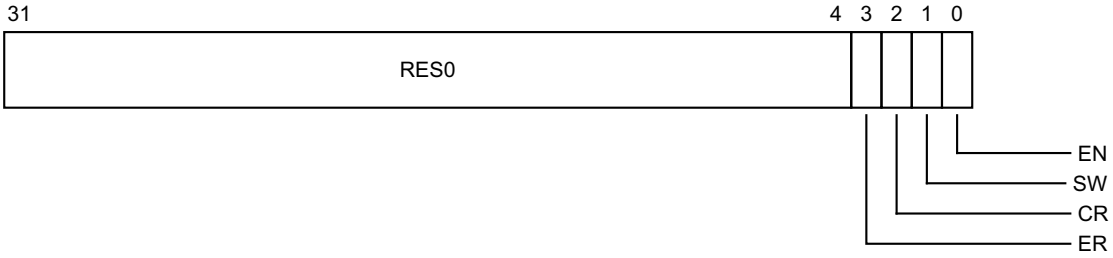
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMUSERENR is architecturally mapped to AArch64 System register PMUSERENR_EL0.

Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMUSERENR is a 32-bit register.

#### Field descriptions

The PMUSERENR bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:4]**

Reserved, RES0.

**ER, bit [3]**

Event counter read trap control:

0 PL0 reads of the PMXEVCNTR and PMEVCNTR<n>, and PL0 read/write access to the PMSELR, are trapped to Undefined mode if PMUSERENR.EN is also 0.

1 PL0 reads of the PMXEVCNTR and PMEVCNTR<n>, and PL0 read/write access to the PMSELR, are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**CR, bit [2]**

Cycle counter read trap control:

0 PL0 reads of the PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0.

1 PL0 reads of the PMCCNTR are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**SW, bit [1]**

Software increment write trap control:

0 PL0 writes to the PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0.

1 PL0 writes to the PMSWINC are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**EN, bit [0]**

Traps PL0 accesses to the Performance Monitors registers to Undefined mode:

0 PL0 accesses to the Performance Monitors registers are trapped to Undefined mode.

1 PL0 accesses to the Performance Monitors registers are not trapped to Undefined mode. Software can access all PMU registers at PL0.

**Note**

- The PMUSERENR is register is always RO at EL0 and not trapped by this bit.
- PL0 cannot read or write PMINTENSET and PMINTENCLR.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMUSERENR:

To access the PMUSERENR:

```
MRC p15,0,<Rt>,c9,c14,0 ; Read PMUSERENR into Rt
MCR p15,0,<Rt>,c9,c14,0 ; Write Rt to PMUSERENR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1110 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.17 PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, PMEVCNTR<x>. PMSELR.SEL determines which event counter is selected.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

If PMSELR.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR.SEL, or PMSELR_EL0.SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, and PMUSERENR.ER==0, PL0 read accesses to this register are trapped to Undefined mode.

If PMUSERENR.EN==0, PL0 write accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, PL0 write accesses to this register are trapped to EL1.

If PMUSERENR_EL0.ER==0, and PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMXEVCNTR is architecturally mapped to AArch64 System register PMXEVCNTR_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMXEVCNTR is a 32-bit register.

## Field descriptions

The PMXEVCNTR bit assignments are:

**PMEVCNTR<x>, bits [31:0]**

Value of the selected event counter, PMEVCNTR<x>, where x is the value stored in PMSELR.SEL.

## Accessing the PMXEVCNTR:

To access the PMXEVCNTR:

```
MRC p15,0,<Rt>,c9,c13,2 ; Read PMXEVCNTR into Rt
MCR p15,0,<Rt>,c9,c13,2 ; Write Rt to PMXEVCNTR
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1101 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.4.18 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

**Purpose**

When PMSELR.SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR.SEL selects the cycle counter, this accesses PMCCFILTR.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

If PMSELR.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR.SEL, or PMSELR_EL0.SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.

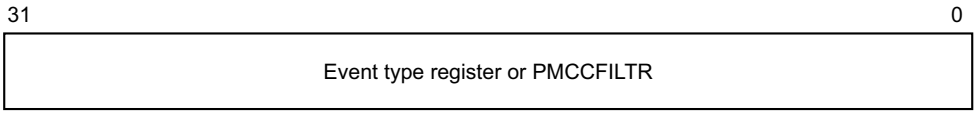
If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMXEVTYPER is architecturally mapped to AArch64 System register PMXEVTYPER_EL0.

When the value of PMSELR.SEL is 31, to select the cycle counter, RW fields in this register have defined reset values that apply only when the PE resets into an Exception level that is using AArch32. See PMCCFILTR for the reset values.



Otherwise, RW fields in this register reset to architecturally UNKNOWN values. This applies whenever PMSELR.SEL selects an event counter.

**Attributes**

PMXEVTYPER is a 32-bit register.

## Field descriptions

The PMXEVTYPER bit assignments are:

**Bits [31:0]**

Event type register or PMCCFILTR.

When PMSELR.SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR.SEL.

## Accessing the PMXEVTYPER:

To access the PMXEVTYPER:

```
MRC p15,0,<Rt>,c9,c13,1 ; Read PMXEVTYPER into Rt
MCR p15,0,<Rt>,c9,c13,1 ; Write Rt to PMXEVTYPER
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1001 | 1101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## G6.5 Generic Timer registers

This section lists the Generic Timer registers in AArch32.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

**Purpose**

Holds the clock frequency of the system counter.

**Usage constraints**

If EL1 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

| EL0 | EL1 |
|---|---|
| Config-RO | RW |

If EL2 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RW |

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RW | RW |

If EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

Can only be written at the highest Exception level implemented. For example, if EL3 is the highest implemented Exception level, CNTFRQ can only be written at EL3.

If EL3 is using AArch64, write accesses to CNTFRQ from Secure EL1modes are UNDEFINED.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CNTKCTL.PL0PCTEN==0, and CNTKCTL.PL0VCTEN==0, PL0 read accesses to this register are trapped to Undefined mode.

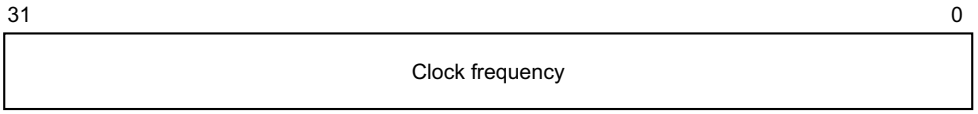
If CNTKCTL_EL1.EL0PCTEN==0, and CNTKCTL_EL1.EL0VCTEN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTFRQ is architecturally mapped to AArch64 System register CNTFRQ_EL0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTFRQ is a 32-bit register.

## Field descriptions

The CNTFRQ bit assignments are:

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

## Accessing the CNTFRQ:

To access the CNTFRQ:

```
MRC p15,0,<Rt>,c14,c0,0 ; Read CNTFRQ into Rt
MCR p15,0,<Rt>,c14,c0,0 ; Write Rt to CNTFRQ
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

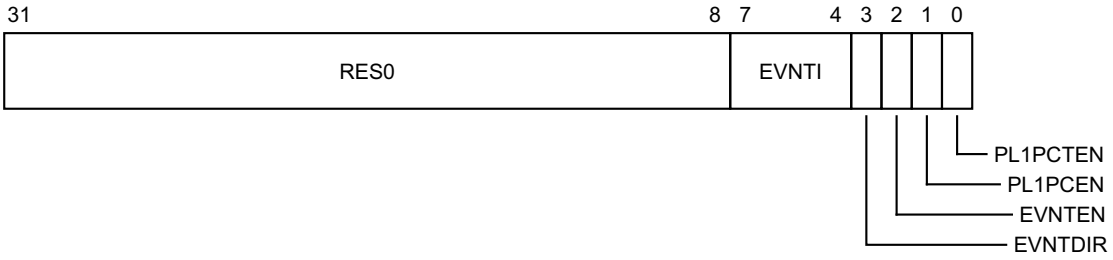
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTHCTL is architecturally mapped to AArch64 System register CNTHCTL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHCTL is a 32-bit register.

#### Field descriptions

The CNTHCTL bit assignments are:

**Bits [31:8]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EVNTI, bits [7:4]**

Selects which bit (0 to 15) of the corresponding counter register (CNTPCT or CNTVCT) is the trigger for the event stream generated from that counter, when that stream is enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EVNTDIR, bit [3]**

Controls which transition of the counter register (CNTPCT or CNTVCT) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

`0` A 0 to 1 transition of the trigger bit triggers an event.

`1` A 1 to 0 transition of the trigger bit triggers an event.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the corresponding counter:

`0` Disables the event stream.

`1` Enables the event stream.

When this register has an architecturally-defined reset value, this field resets to `0`.

**PL1PCEN, bit [1]**

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

`0` Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to Hyp mode.

`1` Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are not trapped to Hyp mode.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to `1`.

**PL1PCTEN, bit [0]**

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

`0` Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode.

`1` Non-secure EL0 and EL1 accesses to the CNTPCT are not trapped to Hyp mode.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to `1`.

## Accessing the CNTHCTL:

To access the CNTHCTL:

```
MRC p15,4,<Rt>,c14,c1,0 ; Read CNTHCTL into Rt
MCR p15,4,<Rt>,c14,c1,0 ; Write Rt to CNTHCTL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1110 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.3 CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

**Purpose**

Control register for the Hyp mode physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

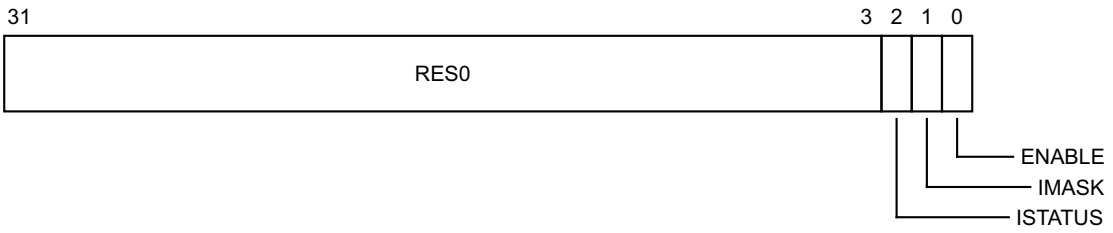
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTHP_CTL is architecturally mapped to AArch64 System register CNTHP_CTL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CTL is a 32-bit register.

#### Field descriptions

The CNTHP_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

0 Timer condition is not asserted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

0 Timer output signal is not masked.

1 Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the CNTHP_CTL:

To access the CNTHP_CTL:

```
MRC p15,4,<Rt>,c14,c2,1 ; Read CNTHP_CTL into Rt
MCR p15,4,<Rt>,c14,c2,1 ; Write Rt to CNTHP_CTL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 100 | 1110 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.4 CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

**Purpose**

Holds the compare value for the Hyp mode physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

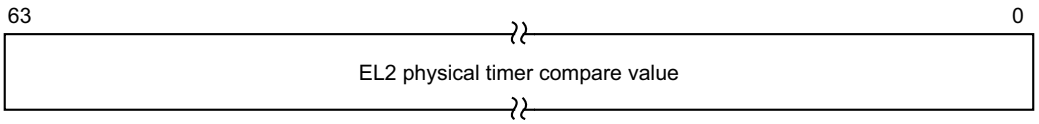
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTHP_CVAL is architecturally mapped to AArch64 System register CNTHP_CVAL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CVAL is a 64-bit register.

#### Field descriptions

The CNTHP_CVAL bit assignments are:

**Bits [63:0]**

EL2 physical timer compare value.

#### Accessing the CNTHP_CVAL:

To access the CNTHP_CVAL:

```
MRRC p15,6,<Rt>,<Rt2>,c14 ; Read CNTHP_CVAL[31:0] into Rt and CNTHP_CVAL[63:32] into Rt2
MCRR p15,6,<Rt>,<Rt2>,c14 ; Write Rt to CNTHP_CVAL[31:0] and Rt2 to CNTHP_CVAL[63:32]
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0110 | 1110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### G6.5.5 CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

**Purpose**

Holds the timer value for the Hyp mode physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

Where the value of CNTHP_CTL.ENABLE is 0:

- A write to CNTHP_TVAL updates the register
- The value held in CNTHP_TVAL continues to decrement
- A read of CNTHP_TVAL returns an UNKNOWN value.

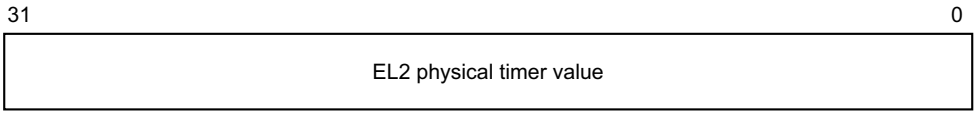
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTHP_TVAL is architecturally mapped to AArch64 System register CNTHP_TVAL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_TVAL is a 32-bit register.

#### Field descriptions

The CNTHP_TVAL bit assignments are:

**Bits [31:0]**

EL2 physical timer value.

#### Accessing the CNTHP_TVAL:

To access the CNTHP_TVAL:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p15,4,<Rt>,c14,c2,0 ; Read CNTHP_TVAL into Rt
MCR p15,4,<Rt>,c14,c2,0 ; Write Rt to CNTHP_TVAL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |

| 1111 | 100 | 1110 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.6 CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | RW | RW |

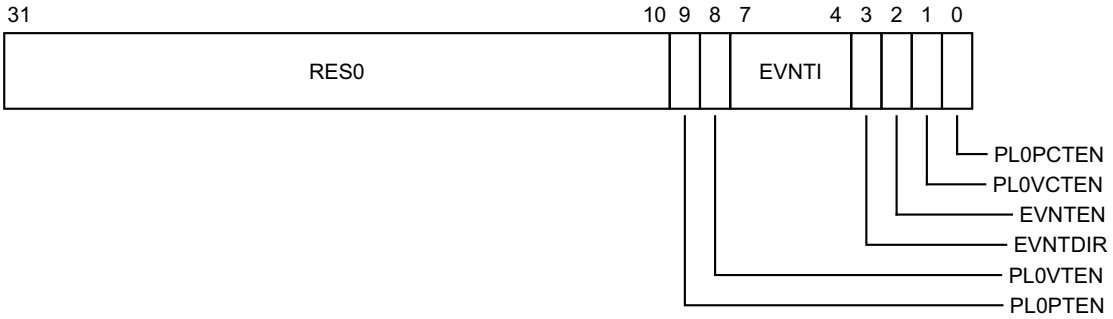
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTKCTL is architecturally mapped to AArch64 System register CNTKCTL_EL1.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTKCTL is a 32-bit register.

#### Field descriptions

The CNTKCTL bit assignments are:

**Bits [31:10]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PL0PTEN, bit [9]**

Traps PL0 accesses to the physical timer registers to Undefined mode.

0 PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.

1 PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**PL0VTEN, bit [8]**

Traps PL0 accesses to the virtual timer registers to Undefined mode.

0 PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to Undefined mode.

1 PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**EVNTI, bits [7:4]**

Selects which bit (0 to 15) of the corresponding counter register (CNTPCT or CNTVCT) is the trigger for the event stream generated from that counter, when that stream is enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EVNTDIR, bit [3]**

Controls which transition of the counter register (CNTPCT or CNTVCT) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0 A 0 to 1 transition of the trigger bit triggers an event.

1 A 1 to 0 transition of the trigger bit triggers an event.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the corresponding counter:

0 Disables the event stream.

1 Enables the event stream.

When this register has an architecturally-defined reset value, this field resets to 0.

**PL0VCTEN, bit [1]**

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

0 PL0 accesses to the CNTVCT are trapped to Undefined mode.
PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0PCTEN is also 0.

1 PL0 accesses to the CNTFRQ and CNTVCT are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**PL0PCTEN, bit [0]**

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

0 PL0 accesses to the CNTPCT are trapped to Undefined mode.
PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0VCTEN is also 0.

1 PL0 accesses to the CNTFRQ and CNTPCT are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

Non-Confidential - Beta

### Accessing the CNTKCTL:

To access the CNTKCTL:

```
MRC p15,0,<Rt>,c14,c1,0 ; Read CNTKCTL into Rt
MCR p15,0,<Rt>,c14,c1,0 ; Write Rt to CNTKCTL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.7 CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CNTP_CTL(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | Config-RW | - | - | - | RW |

CNTP_CTL(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | - | Config-RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_CTL is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | Config-RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CNTHCTL.PL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

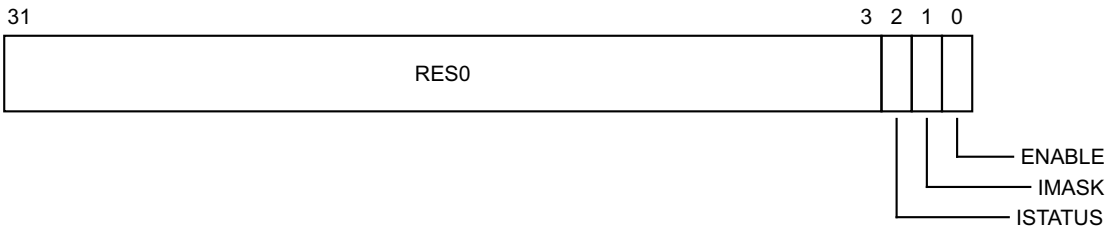
If CNTKCTL.PL0PTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0PTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

AArch32 System register CNTP_CTL is architecturally mapped to AArch64 System register CNTP_CTL_EL0.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

CNTP_CTL is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The CNTP_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

`0` Timer condition is not asserted.

`1` Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

`0` Timer output signal is not masked.

`1` Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

`0` Timer disabled.

`1` Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to `0`.

### Accessing the CNTP_CTL:

To access the CNTP_CTL:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRC p15,0,<Rt>,c14,c2,1 ; Read CNTP_CTL into Rt
MCR p15,0,<Rt>,c14,c2,1 ; Write Rt to CNTP_CTL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.8 CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CNTP_CVAL(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | Config-RW | - | - | - | RW |

CNTP_CVAL(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | - | Config-RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_CVAL is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | Config-RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CNTHCTL.PL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

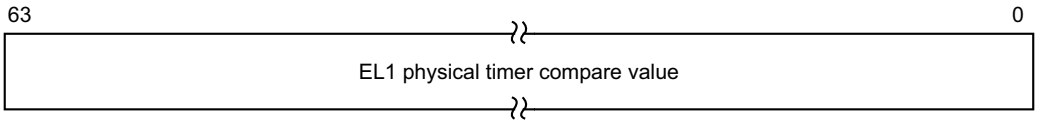
If CNTKCTL.PL0PTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0PTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

AArch32 System register CNTP_CVAL is architecturally mapped to AArch64 System register CNTP_CVAL_EL0.

RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

CNTP_CVAL is a 64-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The CNTP_CVAL bit assignments are:

**Bits [63:0]**

EL1 physical timer compare value.

### Accessing the CNTP_CVAL:

To access the CNTP_CVAL:

```
MRRC p15,2,<Rt>,<Rt2>,c14 ; Read CNTP_CVAL[31:0] into Rt and CNTP_CVAL[63:32] into Rt2
MCRR p15,2,<Rt>,<Rt2>,c14 ; Write Rt to CNTP_CVAL[31:0] and Rt2 to CNTP_CVAL[63:32]
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0010 | 1110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.9 CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer. This provides a 32-bit downcounter.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CNTP_TVAL(S) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | Config-RW | - | - | - | RW |

CNTP_TVAL(NS) is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | - | Config-RW | RW | RW | - |

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_TVAL is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | Config-RW | RW |

Where the value of CNTP_CTL.ENABLE is 0:

- A write to CNTP_TVAL updates the register
- The value held in CNTP_TVAL continues to decrement
- A read of CNTP_TVAL returns an UNKNOWN value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CNTHCTL.PL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

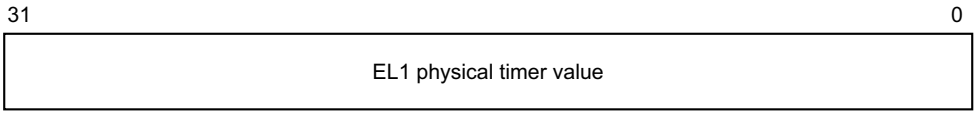
If CNTKCTL.PL0PTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0PTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

AArch32 System register CNTP_TVAL is architecturally mapped to AArch64 System register CNTP_TVAL_EL0.

RW fields in this register reset to architecturally UNKNOWN values.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Attributes**

CNTP_TVAL is a 32-bit register.

## Field descriptions

The CNTP_TVAL bit assignments are:

**Bits [31:0]**

EL1 physical timer value.

## Accessing the CNTP_TVAL:

To access the CNTP_TVAL:

```
MRC p15,0,<Rt>,c14,c2,0 ; Read CNTP_TVAL into Rt
MCR p15,0,<Rt>,c14,c2,0 ; Write Rt to CNTP_TVAL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.10 CNTPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | Config-RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | Config-RO | RO |

When CNTKCTL.EL0PCTEN is set to 1, if CNTPCT is accessible from EL1 in the current Security state then it is also accessible from EL0 in that Security state.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CNTHCTL.PL1PCTEN==0, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.

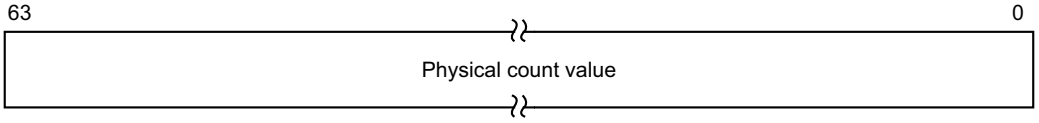
If CNTHCTL_EL2.EL1PCTEN==0, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If CNTKCTL.PL0PCTEN==0, PL0 read accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0PCTEN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.



AArch32 System register CNTPCT is architecturally mapped to AArch64 System register CNTPCT_EL0.

**Attributes**

CNTPCT is a 64-bit register.

#### Field descriptions

The CNTPCT bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [63:0]**

Physical count value.

### Accessing the CNTPCT:

To access the CNTPCT:

```
MRRC p15,0,<Rt>,<Rt2>,c14 ; Read CNTPCT[31:0] into Rt and CNTPCT[63:32] into Rt2
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0000 | 1110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.11 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

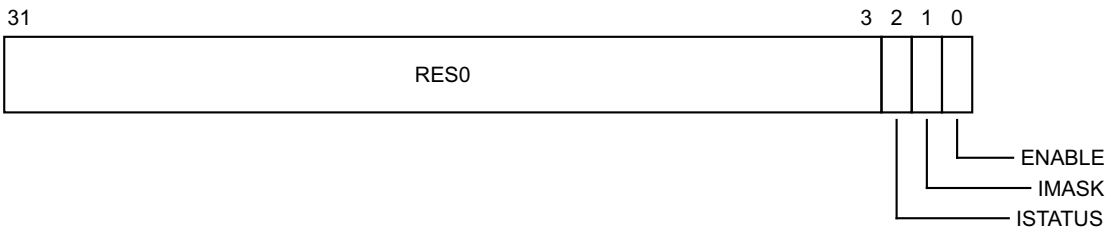
If CNTKCTL.PL0VTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0VTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV_CTL is architecturally mapped to AArch64 System register CNTV_CTL_EL0.



Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CTL is a 32-bit register.

#### Field descriptions

The CNTV_CTL bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

0 Timer condition is not asserted.

1 Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

0 Timer output signal is not masked.

1 Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the CNTV_CTL:

To access the CNTV_CTL:

```
MRC p15,0,<Rt>,c14,c3,1 ; Read CNTV_CTL into Rt
MCR p15,0,<Rt>,c14,c3,1 ; Write Rt to CNTV_CTL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.12 CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

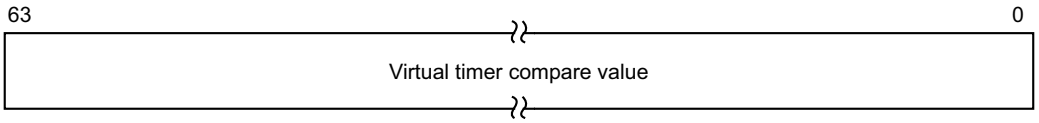
If CNTKCTL.PL0VTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0VTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV_CVAL is architecturally mapped to AArch64 System register CNTV_CVAL_EL0.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CVAL is a 64-bit register.

#### Field descriptions

The CNTV_CVAL bit assignments are:

**Bits [63:0]**

Virtual timer compare value.

### G6.5.13 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RW | RW | RW |

Where the value of CNTV_CTL.ENABLE is 0:

- A write to CNTV_TVAL updates the register
- The value held in CNTV_TVAL continues to decrement
- A read of CNTV_TVAL returns an UNKNOWN value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

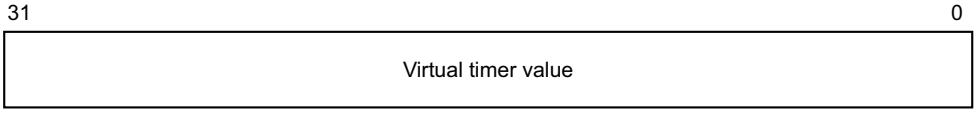
If CNTKCTL.PL0VTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0VTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV_TVAL is architecturally mapped to AArch64 System register CNTV_TVAL_EL0.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_TVAL is a 32-bit register.

#### Field descriptions

The CNTV_TVAL bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Virtual timer value.

### Accessing the CNTV_TVAL:

To access the CNTV_TVAL:

```
MRC p15,0,<Rt>,c14,c3,0 ; Read CNTV_TVAL into Rt
MCR p15,0,<Rt>,c14,c3,0 ; Write Rt to CNTV_TVAL
```

Register access is encoded as follows:

| coproc | opc1 | CRn | CRm | opc2 |
|---|---|---|---|---|
| 1111 | 000 | 1110 | 0011 | 000 |

Non-Confidential - Beta

### G6.5.14 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3778 for exceptions taken to AArch32 state, and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 for exceptions taken to AArch64 state.

Subject to the prioritization rules:

If CNTKCTL.PL0VCTEN==0, PL0 read accesses to this register are trapped to Undefined mode.

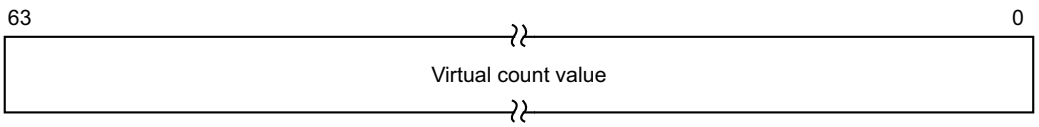
If CNTKCTL_EL1.EL0VCTEN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTVCT is architecturally mapped to AArch64 System register CNTVCT_EL0.

The virtual count value is equal to the physical count value visible in CNTPCT minus the virtual offset visible in CNTVOFF.



When EL2 is not implemented, CNTVOFF is RES0, and the value of this register is the same as the value of CNTPCT.

**Attributes**

CNTVCT is a 64-bit register.

#### Field descriptions

The CNTVCT bit assignments are:

**Bits [63:0]**

Virtual count value.

Non-Confidential - Beta

### Accessing the CNTVCT:

To access the CNTVCT:

```
MRRC p15,1,<Rt>,<Rt2>,c14 ; Read CNTVCT[31:0] into Rt and CNTVCT[63:32] into Rt2
```

Register access is encoded as follows:

| coproc | opc1 | CRm |
|---|---|---|
| 1111 | 0001 | 1110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### G6.5.15 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

| EL0 (NS) | EL0 (S) | EL1 (NS) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| - | - | RW |

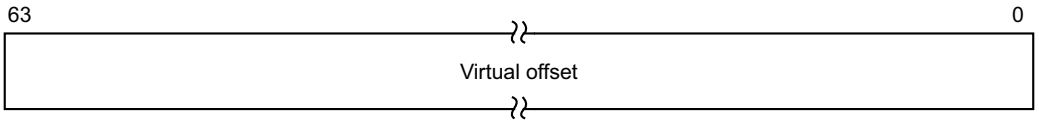
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTVOFF is architecturally mapped to AArch64 System register CNTVOFF_EL2.

If EL2 is not implemented, this register is RES0 from EL3.



When EL2 is implemented and can use AArch32, on a reset into an Exception level that is using AArch32 this register resets to an architecturally UNKNOWN values.

**Attributes**

CNTVOFF is a 64-bit register.

#### Field descriptions

The CNTVOFF bit assignments are:

**Bits [63:0]**

Virtual offset.

#### Accessing the CNTVOFF:

To access the CNTVOFF:

```
MRRC p15,4,<Rt>,<Rt2>,c14 ; Read CNTVOFF[31:0] into Rt and CNTVOFF[63:32] into Rt2
MCRR p15,4,<Rt>,<Rt2>,c14 ; Write Rt to CNTVOFF[31:0] and Rt2 to CNTVOFF[63:32]
```

# Part H
## External Debug

# Chapter H1
# Introduction to External Debug

This chapter introduces the external debug components of ARMv8. It contains the following sections:

- *Introduction to external debug* on page H1-4816.
- *External debug* on page H1-4817.

**Note**

For information about self-hosted debug, see Chapter D2 *AArch64 Self-hosted Debug* and Chapter G2 *AArch32 Self-hosted Debug*.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H1.1 Introduction to external debug

ARMv8 supports both:

**Self-hosted debug**

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

**External debug**

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger. External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the ARM architecture defines required features that are called *external debug features*.

**Note**

**Definition of a debugger**

When the description of external debug in this part of the manual describes a *debugger* as controlling external debug this might be a second on-chip PE or a processor in an off-chip device such as a JTAG debugger.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H1.2 External debug

The following halting debug events are available in ARMv8:

- *Halting Step debug events* on page H3-4864:
  - The debugger can use this resource to make the PE step through code one line at a time.
- *Halt Instruction debug event* on page H3-4874:
  - This might occur when software executes the Halting software breakpoint instruction, `HLT`.
- *Exception Catch debug event* on page H3-4875:
  - This can be programmed to occur on all entries to a given Exception level.
- *External Debug Request debug event* on page H3-4878:
  - An embedded cross-trigger can signal this debug event.
- *OS Unlock Catch debug event* on page H3-4879:
  - This might occur when the state of the OS Lock changes from locked to unlocked.
- *Reset Catch debug events* on page H3-4880:
  - This might occur when the PE exits reset state.
- *Software Access debug event* on page H3-4881:
  - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Halting debug events allow an external debugger to halt the PE. Breakpoints and watchpoints can also halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register,* ITR, passes instructions to the PE to execute in Debug state:
  - The ITR contains a single register, EDITR, and associated flow-control flags.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger:
  - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
  - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.
- The PE cannot service any interrupts in Debug state.

Chapter H2 *Debug State* describes Debug state in more detail.

# Chapter H2
# **Debug State**

This chapter describes Debug state. It contains the following sections:

- *About Debug state* on page H2-4820.
- *Halting the PE on debug events* on page H2-4821.
- *Entering Debug state* on page H2-4828.
- *Behavior in Debug state* on page H2-4832.
- *Exiting Debug state* on page H2-4858.

**Note**

Table K13-1 on page K13-5708 disambiguates the general register references used in this chapter.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register,* ITR, passes instructions to the PE to execute in Debug state.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H2.2 Halting the PE on debug events

For details of debug events see *Introduction to Halting debug events* on page H3-4862 and *Breakpoint and Watchpoint debug events* on page H2-4822.

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See *Halting allowed and halting prohibited*.
- The type of debug event and the programming of the debug control registers.
  - See *Halting debug events* for all Halting debug events.
  - See *Breakpoint and Watchpoint debug events* on page H2-4822 for Breakpoint and Watchpoint debug events.

See also *Other debug exceptions* on page H2-4823.

This means that behavior can be UNPREDICTABLE if the conditions change. See *Synchronization and Halting debug events* on page H3-4882.

*Summary of debug events and possible outcomes* on page H3-4862 summarizes the possible outcomes of each type of debug event.

### H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.
- Halting is always prohibited when `DoubleLockStatus()` == TRUE.
  - This means that OS Double Lock is locked, that is EDPRSR.DLK == 1.
- Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
  - The PE is in Non-secure state and `ExternalInvasiveDebugEnabled()` == FALSE.
  - The PE is in Secure state and `ExternalSecureInvasiveDebugEnabled()` == FALSE.

  **Note**

  See Appendix K2 *Recommended External Debug Interface* for more information on these functions.
- Otherwise, halting is allowed.

See *Pseudocode description of Halting on debug events* on page H2-4827.

### H2.2.2 Halting debug events

When a Halting debug event is generated, it causes entry to Debug state if both:

- Halting is allowed. See *Halting allowed and halting prohibited*.
- The Halting debug event is either:
  - A Halt Instruction debug event when Halting debug is enabled. This means that EDSCR.HDE == 1.
  - Not a Halt Instruction debug event.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

— An Halt Instruction debug event is the only Halting debug event that relies on EDSCR.HDE == 1. This is to prevent malicious code from causing an entry Debug state. EDSCR.HDE == 0 on a Cold reset.

— Halting on Breakpoint and Watchpoint Software debug events is also controlled by EDSCR.HDE. See *Breakpoint and Watchpoint debug events*.

— EDSCR.HDE can be written by software when the OS Lock is locked. Privileged code can use SDCR.TDOSA and HDCR.TDOSA to trap writes to these registers.

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

- If the Halting debug event is a Halt Instruction debug event, it generates an Undefined Instruction exception.
- If the Halting debug event is an Exception Catch debug event or a Software Access debug event, it is ignored.
- In all other cases the Halting debug event is pended, meaning that:
  - The pending Halting debug event is recorded in EDESR.
  - The pending Halting debug event is taken when halting is allowed. See *Pending Halting debug events* on page H3-4882.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to EDESR. *Summary of actions from debug events* on page H2-4826 summarizes the possible outcome for each type of Debug event.

**Note**

Halting debug events never generate Debug exceptions.

### H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

- Halting debug is enabled, that is EDSCR.HDE == 1.
- Halting is allowed. See *Halting allowed and halting prohibited* on page H2-4821.
- The OS Lock is unlocked, that is OSLSR.OSLK == 0.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

MDSCR_EL1.MDE or DBGDSCRext.MDBGen is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

- Generates a Breakpoint or Watchpoint exception.
- Is ignored.

**Note**

EDSCR.HDE is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

See Chapter D2 *AArch64 Self-hosted Debug*, Chapter G2 *AArch32 Self-hosted Debug*, and the Note in *Other debug exceptions* on page H2-4823.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

- Software Breakpoint Instruction exceptions.
- Software Step exceptions.
- Vector Catch exceptions.

The behavior of these events is unchanged when Halting debug mode is enabled, that is when EDSCR.HDE == 1. This means that these events can do one of the following:

- They can generate a debug exception.
- They can be ignored.

For additional information, see Chapter D2 *AArch64 Self-hosted Debug* and Chapter G2 *AArch32 Self-hosted Debug*.

### H2.2.5 Debug state entry and debug event prioritization

The architecture does not define when asynchronous Halting debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED.

Synchronous Halting debug events do have a priority order.

The following are synchronous Halting debug events:

- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous Halting debug events is treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, the synchronous Halting debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

**Note**

Reset Catch and Exception Catch debug events can be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.

The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events, these are taken first.

OS Unlock Catch debug events are always pended and taken asynchronously.

Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously at a later time.

The following list shows how the events are prioritized, with -2 being the highest priority.

**Note**

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in *Synchronous exception types, routing and priorities* on page D1-1563. The Debug events in this section with a negative priority are a higher priority than any synchronous exception. The debug events with fractional priorities have a priority between two or more exceptions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The priority for synchronous debug events is as follows:

**-2** Reset Catch debug event. See *Reset Catch debug events* on page H3-4880.

This debug event has a higher priority than the synchronous exceptions listed in *Synchronous exception types, routing and priorities* on page D1-1563.

**-1** Exception Catch debug event. See *Exception Catch debug event* on page H3-4875.

This debug event can be assigned one of two priorities. When it has a priority of -1, it has a higher priority than the synchronous exceptions listed in the Exception model. See *Exception Catch debug event* on page H3-4875.

**0** Halting Step debug event. See *Halting Step debug events* on page H3-4864.

This debug event has a higher priority than the synchronous exceptions listed in the Exception model.

**1** Software Step debug event. See *Software Step exceptions* on page D2-1686.

**1.5** Exception Catch debug event. See *Exception Catch debug event* on page H3-4875.

This debug event can be assigned one of two priorities, -1 or 1.5. See *Exception Catch debug event* on page H3-4875.

**2 - 3** These events are not debug events.

**4** Breakpoint exception or debug event or Address Matching Vector Catch exception. See *Breakpoint exceptions* on page D2-1653, and *Vector Catch exceptions* on page G2-3937.

These two debug events have the same priority.

**5 - 13** These events are not debug events.

**14** Halt Instruction debug event. See *Halt Instruction debug event* on page H3-4874.

**15 - 19** These events are not debug events.

**19.5** Software Access debug event. See *Software Access debug event* on page H3-4881.

**20 - 21** These events are not debug events.

**22** Watchpoint exception or debug event. See *Watchpoint exceptions* on page D2-1671 for exceptions taken from AArch64 state, or *Watchpoint exceptions* on page G2-3923 for exceptions taken from AArch32 state.

**23** This event is not a debug event.

For Reset Catch debug events and Halting Step debug events the priorities listed in this section only apply when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

The prioritization of asynchronous Halting debug events, including pending Halting debug events taken asynchronously, is IMPLEMENTATION DEFINED. See *Taking Halting debug events asynchronously* on page H3-4883.

For more information on the prioritization of exceptions see *Synchronous exception types, routing and priorities* on page D1-1563.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONSTRAINED UNPREDICTABLE choice of:

- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This only applies if all of the following are true:

- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

## H2.2.6 Forcing entry to Debug state

Entry to Debug state is normally precise, meaning that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state.

A debugger can write a value of 1 to EDRCR.CBRRQ to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is OPTIONAL and it is IMPLEMENTATION DEFINED when it is effective at forcing entry to Debug state.

The PE ignores writes to this bit if either:

- External debugging is not enabled, meaning `ExternalInvasiveDebugEnabled()` == FALSE.
- Secure external debugging is not enabled, meaning `ExternalSecureInvasiveDebugEnabled()` == FALSE, and either:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented.

Example H2-1 shows how entry to Debug state can be forced.

**Example H2-1 Forcing entry to Debug state**

---

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to EDRCR.CBRRQ. The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

---

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

### H2.2.7 Summary of actions from debug events

Table H2-1 on page H2-4826 shows the Software and Halting debug events. In Table H2-1 on page H2-4826 the columns have the following meaning:

**Debug event type**

This means the type of debug event where:

**Other software** Means one of:

- *Software Step exceptions* on page D2-1686.
- *Software Breakpoint Instruction exceptions* on page D2-1650.
- *Vector Catch exceptions* on page D2-1685 for AArch64 state or *Vector Catch exceptions* on page G2-3937 for AArch32 state.

**Other Halting** Means one of the following:

- *Halting Step debug events* on page H3-4864.
- *External Debug Request debug event* on page H3-4878.
- *Reset Catch debug events* on page H3-4880.
- *OS Unlock Catch debug event* on page H3-4879.

Other debug events are referred to explicitly.

**Authentication**

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

**In Secure state** `ExternalSecureInvasiveDebugEnabled()`.

**In Non-secure state** `ExternalInvasiveDebugEnabled()`.

**DLK** This is the value of EDPRSR.DLK. It indicates whether the OS Double Lock is locked, `DoubleLockStatus()` == TRUE.

**OSLK** This is the value of OSLSR.OSLK. It indicates whether the OS Lock is locked.

**HDE** This is the value of EDSCR.HDE. It indicates whether Halting debug is enabled.

The letter X in Table H2-1 indicates that the value can be either 0 or 1.

**Table H2-1 Debug authentication for external debug**

| Debug event type | Authentication | DLK | OSLK | HDE | Behavior |
|---|---|---|---|---|---|
| Other software | X | X | X | X | Handled by the Exception model |
| Breakpoint or Watchpoint debug event | X | 1 | X | X | Handled by the Exception model (ignored) |
| | X | 0 | 1 | X | Handled by the Exception model (ignored) |
| | FALSE | 0 | 0 | X | Handled by the Exception model |
| | TRUE | 0 | 0 | 0 | Handled by the Exception model |
| | TRUE | 0 | 0 | 1 | Entry to Debug state |
| Halt Instruction debug event | FALSE | X | X | X | UNDEFINED |
| | TRUE | 1 | X | X | UNDEFINED |
| | TRUE | 0 | X | 0 | UNDEFINED |
| | TRUE | 0 | X | 1 | Entry to Debug state |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table H2-1 Debug authentication for external debug (continued)**

| Debug event type | Authentication | DLK | OSLK | HDE | Behavior |
|---|---|---|---|---|---|
| Exception Catch debug event | FALSE | X | X | X | Ignored |
| | TRUE | 1 | X | X | Ignored |
| | TRUE | 0 | X | X | Entry to Debug state |
| Software Access debug event | FALSE | X | X | X | Ignored |
| | TRUE | 1 | X | X | Ignored |
| | TRUE | 0 | 1 | X | Ignored |
| | TRUE | 0 | 0 | X | Entry to Debug state |
| Other Halting | FALSE | X | X | X | Debug event is pended |
| | TRUE | 1 | X | X | Debug event is pended |
| | TRUE | 0 | X | X | Entry to Debug state |

### H2.2.8 Pseudocode description of Halting on debug events

The following pseudocode outlines the `Halting()`, `Restarting()`, `HaltingAllowed()`, and `HaltOnBreakpointOrWatchpoint()` functions.

```
// Halted()
// ========

boolean Halted()
    return !(EDSCR.STATUS IN {'000001', '000010'});                    // Halted

// Restarting()
// ============

boolean Restarting()
    return EDSCR.STATUS == '000001';                                   // Restarting

// HaltingAllowed()
// ================
// Returns TRUE if halting is currently allowed, FALSE if halting is prohibited.

boolean HaltingAllowed()
    if Halted() || DoubleLockStatus() then
        return FALSE;
    elsif IsSecure() then
        return ExternalSecureInvasiveDebugEnabled();
    else
        return ExternalInvasiveDebugEnabled();

// HaltOnBreakpointOrWatchpoint()
// ==============================
// Returns TRUE if the Breakpoint and Watchpoint debug events should be considered for Debug
// state entry, FALSE if they should be considered for a debug exception.

boolean HaltOnBreakpointOrWatchpoint()
    return HaltingAllowed() && EDSCR.HDE == '1' && OSLSR_EL1.OSLK == '0';
```

## H2.3 Entering Debug state

On entry to Debug state the preferred restart address and PSTATE are saved in DLR and DSPSR. The PE remains in the mode and security state from which it entered Debug state.

If EDRCR.CBRRQ has a value of 0, entry to Debug state is precise. If EDRCR.CBRRQ has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in EDWAR. See *Determining the memory location that caused a Watchpoint exception* on page D2-1678 for an exception taken from AArch64 state, or *Determining the memory location that caused a Watchpoint exception* on page G2-3930 for an exception taken from AArch32 state.

Other than the effect on PSTATE and EDSCR, entry to Debug state is not a *Context synchronization operation*. The effects of entry to Debug state on PSTATE and EDSCR are synchronized.

### H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of PSTATE.T before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from EDSCR.RW, and the current Exception level can be read from EDSCR.EL.

The current endianness state, PSTATE.E, is unchanged on entry to Debug state.

**Note**

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by SCTLR.EE.
- If EL2 is using AArch32 state, the current endianness state can differ from that indicated by HSCTLR.EE.
- On entry to Debug state from AArch32 state, PSTATE.SS is copied to DSPSR.SS, even though the PE remains in AArch32 state.

See also *Effect of entering Debug state on PSTATE* on page H2-4829.

### H2.3.2 Effect of entering Debug state on DLR and DSPSR

DLR is set to the preferred restart address for the debug event, that depends on the event type. The value of PSTATE is saved in DSPSR. For entry to Debug state from AArch32 state, the values saved in DSPSR.IT are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in Chapter D2 *AArch64 Self-hosted Debug* and Chapter G2 *AArch32 Self-hosted Debug*.
- For Halt Instruction debug events DLR is set to the address of the `HLT` instruction and DSPSR.IT is correct for the `HLT` instruction.
- For Software Access debug events, DLR is set to the address of the accessing instruction and DSPSR.IT is correct for this instruction.
- For Halting Step debug events taken synchronously, DLR and DSPSR are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and PSTATE for, the instruction after the one that was stepped.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For Exception Catch debug events:
  - If the debug event is generated on taking an exception to a trapped Exception level, the DLR is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the VBAR for the Exception level has never been initialized. The DSPSR records the value of PSTATE after taking the exception. The exception catch occurs after the SPSR and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.

    **Note**

    Depending on the target Exception level and Execution state for the exception, the Link register is one of ELR_EL1, ELR_EL2, ELR_EL3, ELR_hyp, or LR (R14).

  - If the debug event is generated on an exception return to a trapped Exception level, the DLR is set to the target address of the exception return and the DSPSR records the value of PSTATE after the exception return.
- Reset Catch debug events taken synchronously behave like Exception Catch debug events.
- For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the DLR is set to is set to the reset address and the DSPSR records the reset value of PSTATE.
- For pending Halting debug events and External Debug Request debug events, DLR is set to the address of the first instruction that must be executed on exit from Debug state and DSPSR.IT is correct for this instruction. See *Pending Halting debug events* on page H3-4882.

Normally DLR is aligned according to the instruction set state indicated in DSPSR. However, a debug event might be taken at a point where the PC is not aligned.

### H2.3.3 Effect of Debug state entry on System registers, the Event register, and exclusive monitors

Entering Debug state has no effect on System registers other than DLR and DSPSR. In particular, ESRs, FARs, and FSRs are not updated on entering Debug state. SCR is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and exclusive monitors.

**Note**

Entry to Debug state might set the Event Register or clear the exclusive monitors, or both. However, this is not a requirement, and debuggers must not rely on any implementation specific behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and exclusive monitors.

### H2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on PSTATE is described in *Entering Debug state* on page H2-4828 and *Entering Debug state from AArch32 state* on page H2-4828.

PSTATE.{E, M, nRW, EL, SP} are unchanged on entry to Debug state.

PSTATE.IL is cleared to 0 on entry to Debug state, after being saved in DSPSR_EL0.

The other PSTATE fields are ignored and not observable in Debug state:

- PSTATE.{N, Z, C, V, Q, GE} are unchanged.
- PSTATE.{IT, T, SS, D, A, I, F} are set to UNKNOWN values, after being saved in DSPSR_EL0.

For more information see *Process state (PSTATE) in Debug state* on page H2-4832.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

### H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with DSPSR.SS set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with DSPSR.SS set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with DSPSR.SS set to 0. This is because PSTATE.SS is set to 0 by taking the exception.
- If the PE is reset, PSTATE.SS is reset to 0. If the following debug events are enabled, the PE enters Debug state with DSPSR.SS set to 0:
  - Reset Catch debug event at the reset Exception level.
  - Exception Catch debug event at the reset Exception level.
  - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and DSPSR.SS is set to 0.

### H2.3.7 Pseudocode description of entering Debug state

The following pseudocode shows the definition of the `DebugHalt()` function.

```
constant bits(6) DebugHalt_Breakpoint      = '000111';
constant bits(6) DebugHalt_EDBGRQ          = '010011';
constant bits(6) DebugHalt_Step_Normal     = '011011';
constant bits(6) DebugHalt_Step_Exclusive  = '011111';
constant bits(6) DebugHalt_OSUnlockCatch   = '100011';
constant bits(6) DebugHalt_ResetCatch      = '100111';
constant bits(6) DebugHalt_Watchpoint      = '101011';
constant bits(6) DebugHalt_HaltInstruction = '101111';
constant bits(6) DebugHalt_SoftwareAccess  = '110011';
constant bits(6) DebugHalt_ExceptionCatch  = '110111';
constant bits(6) DebugHalt_Step_NoSyndrome = '111011';
```

The pseudocode for the `UpdateEDSCRFields()` function is as follows:

```
// UpdateEDSCRFields()
// ===================
// Update EDSCR processor state fields

UpdateEDSCRFields()
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    if !Halted() then
        EDSCR.EL = '00';
        EDSCR.NS = bit UNKNOWN;
        EDSCR.RW = '1111';
    else
        EDSCR.EL = PSTATE.EL;
        EDSCR.NS = if IsSecure() then '0' else '1';
        EDSCR.RW<1> = (if ELUsingAArch32(EL1) then '0' else '1');
        if PSTATE.EL != EL0 then
            EDSCR.RW<0> = EDSCR.RW<1>;
        else
            EDSCR.RW<0> = (if UsingAArch32() then '0' else '1');
        if !HaveEL(EL2) || (HaveEL(EL3) && SCR_GEN[].NS == '0') then
            EDSCR.RW<2> = EDSCR.RW<1>;
        else
            EDSCR.RW<2> = (if ELUsingAArch32(EL2) then '0' else '1');
        if !HaveEL(EL3) then
            EDSCR.RW<3> = EDSCR.RW<2>;
        else
            EDSCR.RW<3> = (if ELUsingAArch32(EL3) then '0' else '1');

    return;
```

The pseudocode for the `Halt()` function is as follows:

```
// Halt()
// ======

Halt(bits(6) reason)

    CTI_SignalEvent(CrossTriggerIn_CrossHalt);  // Trigger other cores to halt

    DLR_EL0 = ThisInstrAddr();
    DSPSR_EL0 = GetPSRFromPSTATE();
    DSPSR_EL0.SS = PSTATE.SS;                   // Always save PSTATE.SS

    EDSCR.ITE = '1';  EDSCR.ITO = '0';
    if IsSecure() then
        EDSCR.SDD = '0';                        // If entered in Secure state, allow debug
    elsif HaveEL(EL3) then
        EDSCR.SDD = (if ExternalSecureInvasiveDebugEnabled() then '0' else '1');
    else
        assert EDSCR.SDD == '1';                // Otherwise EDSCR.SDD is RES1
    EDSCR.MA = '0';

    // PSTATE.{SS,D,A,I,F} are not observable and ignored in Debug state, so behave as if
    // UNKNOWN. PSTATE.{N,Z,C,V,Q,GE} are also not observable, but since these are not changed on
    // exception entry, this function also leaves them unchanged. PSTATE.{E,M,nRW,EL,SP} are
    // unchanged. PSTATE.IL is set to 0.
    if UsingAArch32() then
        PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
        //  In AArch32, all instructions are T32 and unconditional.
        PSTATE.IT = '00000000';  PSTATE.T = '1'; // PSTATE.J is RES0
    else
        PSTATE.<SS,D,A,I,F> = bits(5) UNKNOWN;
    PSTATE.IL = '0';

    StopInstructionPrefetchAndEnableITR();
    EDSCR.STATUS = reason;                      // Signal entered Debug state
    UpdateEDSCRFields();                        // Update EDSCR processor state flags.

    return;
```

Non-Confidential - Beta

## H2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, EDITR. The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch64 state it executes A64 instructions.
- If the PE is in AArch32 state it executes T32 instructions.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See *Debug state instructions, DCPS, DRPS, MRS, MSR* on page H2-4847. In Non-debug state these instructions are UNDEFINED.

### H2.4.1 Process state (PSTATE) in Debug state

PSTATE.{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE only executes T32 instructions and PSTATE.IT is ignored.
- Asynchronous exceptions and debug events are ignored.
- Software step is inactive.

Instructions executed in Debug state indirectly read PSTATE.{IL, E, M, nRW, EL, SP} as they would in Non-debug state.

### H2.4.2 Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- Debug state instructions. These are instructions that are changed in Debug state. See *A64 instructions that are changed in Debug state* on page H2-4833 and *T32 instructions that are changed in Debug state* on page H2-4837.
- Instructions that are unchanged in Debug state. See *A64 instructions that are unchanged in Debug state* on page H2-4833 and *T32 instructions that are unchanged in Debug state* on page H2-4837.
- Instructions that are UNPREDICTABLE in Debug state. See *A64 instructions that are UNPREDICTABLE in Debug state* on page H2-4834 and *T32 instructions that are UNPREDICTABLE in Debug state* on page H2-4839.

All T32 instructions are treated as unconditional, regardless of PSTATE.IT. See *Process state (PSTATE) in Debug state*.

If EDSCR.SDD == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See *Security in Debug state* on page H2-4845

#### Executing A64 instructions in Debug state

The following sections describe the behavior of the A64 instructions in Debug state:

- *A64 instructions that are changed in Debug state* on page H2-4833.
- *A64 instructions that are unchanged in Debug state* on page H2-4833.
- *A64 instructions that are UNPREDICTABLE in Debug state* on page H2-4834.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### A64 instructions that are changed in Debug state

The following A64 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- DCPS

  **Note**

  DCPS can be UNDEFINED in certain conditions in Debug state. See *DCPS* on page H2-4847.

- DRPS
- MRS (DLR_EL0), MRS (DSPSR_EL0), MSR (DLR_EL0), MSR (DSPSR_EL0)

For more information see *Debug state instructions, DCPS, DRPS, MRS, MSR* on page H2-4847.

### A64 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state:

**Any instruction that is UNDEFINED in Non-debug state**

This list of instructions excludes:

- Any instruction listed in *A64 instructions that are changed in Debug state*.
- Any instruction listed in *A64 instructions that are UNPREDICTABLE in Debug state* on page H2-4834 that is UNDEFINED because an enable or disable bit is not RES0 or RES1

**Instructions that move System or Special-purpose registers to or from a general-purpose register**

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes PSTATE access instructions.

These instructions are:

- MRS <special_reg>, MSR <special_reg>

  **Note**

  This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, and CurrentEL.

- MRS <system_reg>, MSR <system_reg>

**Floating-point moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- FMOV (between a general-purpose register and a single-precision register).
- FMOV (between a general-purpose register and a double-precision register).
- FMOV (between a general-purpose register and a SIMD element).

**SIMD moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- INS (from a general-purpose register to a SIMD element).
- UMOV (from a SIMD element to a general-purpose register).

**Barriers** These instructions are:

- ISB.
- DSB.
- DMB.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Memory access instructions at various access sizes**

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Unscaled (9-bit signed) immediate offset.
  - Immediate (9-bit signed) post-indexed.
  - Immediate (9-bit signed) pre-indexed.
  - Unprivileged (9-bit signed).
- Not literal.
- One of the following types:
  - (Single) register.
  - Exclusive.
  - Exclusive pair.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive pair.
- 32-bit and 64-bit target register variants.

These instructions are:

- `LDR`, `LDRB`, `LDRH`, `LDRSB`, `LDRSH`, `LDRSW` (immediate, not literal).
- `LDUR`, `LDURB`, `LDURH`, `LDURSB`, `LDURSH`, `LDURSW` (immediate).
- `LDTR`, `LDTRB`, `LDTRH`, `LDTRSB`, `LDTRSH`, `LDTRSW` (immediate).
- `LDAR`, `LDARB`, `LDARH`, `LDXR`, `LDXRB`, `LDXRH`, `LDAXR`, `LDAXRB`, `LDAXRH`.
- `LDXP`, `LDAXP`.
- `STR`, `STRB`, `STRH` (immediate).
- `STUR`, `STURB`, `STURH` (immediate).
- `STTR`,`STTRB`, `STTRH` (immediate).
- `STLR`, `STLRB`, `STLRH`, `STXR`, `STXRB`, `STXRH`, `STLXR`, `STLXRB`, `STLXRH`.
- `STXP`, `STLXP`.

**Move immediate to general-purpose register**

These instructions are:

- `MOVZ`, `MOVN`, `MOVK` (immediate).
- `MOV` (between a general-purpose register and the stack pointer).

**Cache maintenance, Send Event, NOP, and Clear Exclusive**

These instructions are:

- `IC`.
- `DC`.
- `TLBI`.
- `AT`.
- `SEV`, `SEVL`.
- `NOP` (no operation hint).
- `CLREX`.

### *A64 instructions that are UNPREDICTABLE in Debug state*

This subsection describes all instruction not listed in either:

- *A64 instructions that are changed in Debug state* on page H2-4833.
- *A64 instructions that are unchanged in Debug state* on page H2-4833.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR_EL0 and DSPSR_EL0 to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is CCMP.

**Exception-generating instructions**

These instructions are:

- SVC.
- HVC.
- SMC.
- BRK.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in *Exceptions in Debug state* on page H2-4851

**Note**

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSCR.SDD is set to 1.

**Instructions that explicitly write to the PC (branches)**

These instructions are:

- B, B.cond, BL, BLR, BR, CBZ, CBNZ, RET, TBZ, TBNZ.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

**Exception return and related instructions**

These instructions are:

- ERET.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

- They execute as in Non-debug state without branching. They set DSPSR_EL0 and DLR_EL0 to UNKNOWN values, and either:
  - Execute as DRPS instead of performing an exception return, using UNKNOWN SPSR values.
  - Not change the Exception level.

**Instructions that explicitly modify PSTATE, other than DCPS and DRPS**

These instructions are:

- MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSel (immediate).
- MSR NZCV (register), MSR DAIF (register), MSR SPSel (register).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

**Instructions that suspend execution**

These instructions are:

- WFE, WFI

These instructions behave in one of the following ways:

- Are UNDEFINED.
- Execute as a NOP.
- Generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See *Configurable instruction enables and disables, and trap controls* on page D1-1575.

**Note**

This means that these instructions must not suspend execution.

**Instructions that read the PC**

These instructions are:

- LDR (literal), LDRSW (literal).
- ADR, ADRP.
- PRFM (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, using an UNKNOWN value for the PC operand.

**Instructions that read the PSTATE.{N, Z, C, V} or other PSTATE fields**

These instructions are:

- CSEL, CSINC, CSINV, CSNEG, CCMN, CCMP, FCSEL, FCCMP, FCCMPE.
- ADC, ADCS,SBC, SBCS.
- MRS NZCV, MRS DAIF, MRS SPSel, MRS CurrentEL.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the condition flag.
  - For the MRS instruction, they return an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Instructions that explicitly modify the PSTATE. {N, Z, C, V, Q, GE}**

These instructions are:

- `ADDS`, `SUBS`, `ADCS`, `SBCS`, `ANDS`, `BICS`, `CCMN`, `CCMP`.
- `FCMP`, `FCMPE`, `FCCMP`, `FCCMPE`.
- `MSR NZCV` (register).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a `NOP`.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

**All other instructions**

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a `NOP`.
- They have the same behavior as in Non-debug state.

**Note**

This includes instructions defined as UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE in Debug state.

## Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- *T32 instructions that are changed in Debug state*.
- *T32 instructions that are unchanged in Debug state*.
- *T32 instructions that are UNPREDICTABLE in Debug state* on page H2-4839.

### *T32 instructions that are changed in Debug state*

The following T32 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- `DCPS`

  **Note**

  `DCPS` can be UNDEFINED in certain conditions in Debug state. See *DCPS* on page H2-4847.

- `MRC p15,3,<Rt>,c4,c5,0` (DSPSR)
- `MCR p15,3,<Rt>,c4,c5,0` (DSPSR)
- `MRC p15,3,<Rt>,c4,c5,1` (DLR)
- `MCR p15,3,<Rt>,c4,c5,1` (DLR)

In addition, `ERET` is executed as DRPS in Debug state.

For more information see *Debug state instructions, DCPS, DRPS, MRS, MSR* on page H2-4847.

### *T32 instructions that are unchanged in Debug state*

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR.{N, Z, C, V} as the source or destination register is not included in the list. Moreover, the list only includes the 32-bit T32 encodings.

**Any instruction that is UNDEFINED in Non-debug state**

The list of instructions:

- Excludes any instruction listed in *T32 instructions that are changed in Debug state*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Excludes any instruction listed in *T32 instructions that are UNPREDICTABLE in Debug state* on page H2-4839 that is UNDEFINED because an enable or disable bit is not RES0 or RES1

**Instructions that move System or Special-purpose registers to or from a general-purpose register**

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- `MRS <spec_reg>_<mode>`, `MSR <spec_reg>_<mode>`.

  **Note**

  This does not apply to cases which are UNPREDICTABLE in Non-debug state in the current mode.

- `MRC <system_reg>`, `MCR <system_reg>`

  **Note**

  This includes all allocated CP15 and CP14 System registers, other than an `MRC` move to APSR_nzcv.

- `MRS SPSR`, `MSR SPSR`
- `VMRS <vfp_system_reg>`, `VMSR <vfp_system_reg>`

  **Note**

  This includes all allocated Advanced SIMD and floating-point System registers, other than an a `VMRS` move to APSR_nzcv.

**Floating-point moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- `VMOV` (between a general-purpose register and a single-precision register).
- `VMOV` (between a general-purpose register and a doubleword floating-point register).

**SIMD moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- `VMOV` (between a general-purpose register and a scalar).

**Barriers** These instructions are:

- `ISB`.
- `DSB`.
- `DMB`.

**Memory access instructions at various access sizes**

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Immediate (8-bit or 12-bit) offset.
  - Immediate (8-bit) post-indexed.
  - Immediate (8-bit) pre-indexed.
  - Unprivileged (8-bit).
- Not literal.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- One of the following types:
  - (Single) register.
  - Dual.
  - Exclusive.
  - Exclusive doubleword.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive doubleword.

These instructions are:

- `LDR.W`, `LDRB.W`, `LDRH.W`, `LDRD`, `LDRSB.W`, `LDRSH.W` (immediate, not literal).
- `LDRT`, `LDRBT`, `LDRHT`, `LDRSBT`, `LDRSHT` (immediate).
- `LDREX`, `LDREXB`, `LDREXH`, `LDA`, `LDAB`, `LDAH`, `LDAEX`, `LDAEXB`, `LDAEXH`.
- `LDREXD`, `LDAEXD`.
- `STR.W`, `STRB.W`, `STRH.W`, `STRD` (immediate).
- `STRT`, `STRBT`, `STRHT` (immediate).
- `STREX`, `STREXB`, `STREXH`, `STL`, `STLB`, `STLH`, `STLEX`, `STLEXB`, `STLEXH`.
- `STREXD`, `STLEXD`.

**Move to general-purpose register**

These instructions are:

- `MOVW`, `MOVT` (immediate).

**Cache maintenance, Send Event, `NOP`, and Clear Exclusive**

These instructions are:

- `ICIALLU`, `ICIALLUIS`, `ICIMVAU` (CP15 operations).
- `DCCIMVAC`, `DCCISW`, `DCCMVAC`, `DCCMVAU`, `DCCSW`, `DCIMVAC`, `DCISW` (CP15 operations).
- `TLBIALL`, `TLBIALLH`, `TLBIALLHIS`, `TLBIALLIS`, `TLBIALLNSNH`, `TLBIALLNSNHIS`, `TLBIASID`, `TLBIASIDIS`, `TLBIIPAS2`, `TLBIIPAS2IS`, `TLBIIPAS2L`, `TLBIIPAS2LIS`, `TLBIMVA`, `TLBIMVAA`, `TLBIMVAAIS`, `TLBIMVAAL`, `TLBIMVAALIS`, `TLBIMVAH`, `TLBIMVAHIS`, `TLBIMVAIS`, `TLBIMVAL`, `TLBIMVALH`, `TLBIMVALHIS`, `TALBIMVALIS` (CP15 operations).
- `ATS12NSOPR`, `ATS12NSOPW`, `ATS12NSOUR`, `ATS12NSOUW`, `ATS1CPR`, `ATS1CPW`, `ATS1CUR`, `ATS1CUW`, `ATS1HR`, `ATS1HW` (CP15 operations).
- `BPIALL`, `BPIALLIS`, `BPIMVA` (CP15 operations).
- `SEV.W`, `SEVL.W`.
- `NOP.W` (no operation hint).
- `CLREX`.

### *T32 instructions that are UNPREDICTABLE in Debug state*

This subsection describes all instruction not listed in either:

- *T32 instructions that are changed in Debug state* on page H2-4837.
- *T32 instructions that are unchanged in Debug state* on page H2-4837.

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a `NOP`.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR and DSPSR to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

**Exception-generating instructions**

These instructions are:

- SVC.
- HVC.
- SMC.
- UDF.
- BKPT.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in *Exceptions in Debug state* on page H2-4851

**Note**

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSCR.SDD is set to 1.

**Instructions that explicitly write to the PC (branches)**

These instructions are:

- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set DSPSR and DLR to UNKNOWN values.

**Exception return and related instructions**

These instructions are:

- SRS, RFE, SUBS pc, 1r, and related instructions.

**Note**

The T32 ERET instruction is decoded as DRPS and is not included in this list.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- They execute as in Non-debug state without branching, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values, and either:
  - Execute as DRPS instead of performing an exception return, using UNKNOWN SPSR values.
  - Not changing Exception level or PE mode.

**Note**

The T32 ERET instruction is decoded as DRPS and is not included in this list.

**Instructions that explicitly modify PSTATE, other than DCPS and DRPS**

These instructions are:

- CPS, SETEND, IT.
- MSR CPSR (register or immediate).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

**Instructions that suspend execution**

These instructions are:

- WFE, WFI.

These instructions behave in one of the following ways:

- Are UNDEFINED.
- Execute as a NOP.
- Generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See *Configurable instruction enables and disables, and trap controls* on page G1-3846.

  **Note**

  This means that these instructions must not suspend execution.

**Instructions that read the PC**

These instructions are:

- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

**Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields**

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the condition flag.
  - For the `MRS` instruction, they return an UNKNOWN value

**Instructions that explicitly modify PSTATE.{N, Z, C, V, Q, GE}**

These instructions are:

- `CMP, TST, TEQ, CMN.`
- `<opc>S.`
- `MRC p14,0,APSR_nzcv,c0,c1,0` (DBGDSCRint).
- `MSR CPSR`, `MSR APSR`, (register or immediate).
- `VMRS APSR_nzcv,FPSCR.`
- `QADD, QDADD, QSUB, QDSUB.`
- `SMLABB. SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMUAD.`
- `SSAT, SSAT16, USAT, USAT16.`
- `SADD, SADD8, SADD16, SASX, SSAX, SSUB, SSUB8, SSUB16.`
- `UADD, UADD8, UADD16, UASX, USAX, USAUB, USUN8, USUB16.`

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a `NOP`.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

**All other instructions**

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a `NOP`.
- They have the same behavior as in Non-debug state.

**Note**

This includes instructions defined as UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register, such as:

```
MOV.W R15, #<uimm16>
LDREX R15, [Rn]
```

Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors* describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
  - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
  - Might set DLR and DSPSR to UNKNOWN values.
  - Might have any of the other permitted behaviors.
- Instructions that specify R15 as a source operand:
  - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
  - Might have any of the other permitted behaviors, including using an UNKNOWN value.

Non-Confidential - Beta

### H2.4.3 Decode tables

The syntax in the tables is defined as follows:

**1** The bit has a fixed value of 1.

**0** The bit has a fixed value of 0.

**!=** The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.

**Note**

The instruction encodings in Chapter C6 *A64 Base Instruction Descriptions* and Chapter F6 *T32 and A32 Base Instruction Set Instruction Descriptions* might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or UNDEFINED, in which case the instruction is UNDEFINED or UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:

- Chapter C6 *A64 Base Instruction Descriptions*.
- Chapter F6 *T32 and A32 Base Instruction Set Instruction Descriptions*.

For information about the syntax used in Table H2-2, Table H2-3, Table H2-4 on page H2-4844, and Table H2-5 on page H2-4845, see:

- *Common syntax terms* on page C1-121.
- *Assembler symbols* on page F2-2443.

Table H2-2 shows the A64 instructions that are modified in Debug state. For details of how these are packed in EDITR, see *EDITR, External Debug Instruction Transfer Register* on page H9-5016.

**Table H2-2 Modified A64 instructions in Debug state**

| 31 30 29 28 | 27 26 25 24 | 23 22 21 20 | 19 18 17 16 | 15 14 13 12 | 11 10 9 8 | 7 6 5 4 | 3 2 1 0 | Description |

## H2.4.4 Security in Debug state

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure debug disabled flag, EDSCR.SDD.

**On entry to Debug state**

If entering in Secure state, EDSCR.SDD is set to 0. Otherwise EDSCR.SDD is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`. That is:

- If `ExternalSecureInvasiveDebugEnabled()` == TRUE, EDSCR.SDD is set to 0.
- If `ExternalSecureInvasiveDebugEnabled()` == FALSE, EDSCR.SDD is set to 1.

**Note**

Normally, if `ExternalSecureInvasiveDebugEnabled()` == FALSE then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a *Context synchronization operation* to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**In Debug state**

The value of EDSCR.SDD does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

**Note**

- DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID} are not frozen in Debug state.
- If EDSCR.SDD set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.

**In Non-debug state**

EDSCR.SDD returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a *Context synchronization operation* is required to guarantee their effect.

**Note**

- In Non-debug state, EDSCR.SDD is unaffected by the Security state of the PE.
- A *Context synchronization operation* is also required to guarantee that changes in the authentication signals are visible in DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID}.

If EL3 is not implemented and the implemented Security state is Non-Secure state, EDSCR.SDD is RES1.

### H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute *Debug state instructions, DCPS, DRPS, MRS, MSR* on page H2-4847.
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

In Non-debug state, the Debug state instructions are UNDEFINED, except for the T32 `DRPS` instruction. The T32 `DRPS` instruction uses the encoding of the Non-debug T32 `ERET` instruction.

In Debug state, the Debug state instructions can be executed at any Exception level. However, there are some cases where the instructions are UNDEFINED. For more information, see *Debug state instructions, DCPS, DRPS, MRS, MSR* on page H2-4847. These instructions generate an Undefined Instruction exception when they are UNDEFINED. If this Undefined Instruction exception is taken to an Exception level using AArch64, it is reported using ESR_ELx.EC, with the code `0x00`, and if taken to AArch32 Hyp mode, reported using HSR.EC `of 0x00`.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be UNDEFINED or trapped in Non-debug state. These instruction are:

- The `MRS` and `MSR` instructions that access DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0 in AArch64 state.
- The `MRC` and `MCR` instructions that access DBGDTRTXint and DBGDTRRXint in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and UNDEFINED instructions, and includes generating exceptions when the System registers trap or disable an instruction.

### H2.4.6 Debug state instructions, DCPS, DRPS, MRS, MSR

ARMv8 defines instructions to change between Exception levels in Debug state. These instructions can also change the mode at the current Exception level.

#### DCPS

DCPS allows the debugger to move the PE to a higher Exception level or to a specific mode at the current Exception level.

If the DCPS instruction is executed in AArch32 state and the target Exception level is using AArch64:

- The current instruction set switches from T32 to A64.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See *Execution state* on page D1-1517.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE can change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- In AArch64, the current endianness is set according to SCTLR_ELx.EE for the target Exception level.
- In AArch32, the current endianness is set according to SCTLR.EE or HSCTLR.EE for the target Exception level.

The assembler syntax for the DCPS instructions is:

```
DCPS1    {#<uimm16>}
DCPS2    {#<uimm16>}
DCPS3    {#<uimm16>}
```

<uimm16> is only available in the A64 encoding and is ignored by hardware.

The decode can be found in the instruction descriptions for DCPS1, DCPS2, and DCPS3 for A64, and DCPS1, DCPS2, DCPS3 for T32.

DCPS is UNDEFINED in Non-debug state.

Table H2-6 on page H2-4848 shows the target of the instruction. In Table H2-6 on page H2-4848 the entries have the following meaning:

**EL1h/Svc** This means that the target is:
- EL1h if EL1 is using AArch64.
- EL1 and Supervisor mode if EL1 is using AArch32.

**EL2h/Hyp** This means that the target is:
- EL2h if EL2 is using AArch64.
- EL2 and Hyp mode if EL2 is using AArch32.

**EL3h/Monitor** This means that the target is:
- EL3h if EL3 is using AArch64.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- EL3 and Monitor mode if EL3 is using AArch32.

**Table H2-6 Target for DCPS instructions in Debug state**

| Instruction | Target when taken from Exception level: | | | | |
|---|---|---|---|---|---|
| | EL0 | EL1 | EL2 | EL3 (AArch64) | EL3 (AArch32) |
| DCPS1 | EL1h/Svc | EL1h/Svc | EL2h/Hyp | EL3h | Svc, clears NS to 0 |
| DCPS2 | EL2h/Hyp | EL2h/Hyp | EL2h/Hyp | EL3h | UNDEFINED |
| DCPS3 | EL3h/Monitor | EL3h/Monitor | EL3h/Monitor | EL3h | Monitor, clears NS to 0 |

**Note**

- In AArch32 Monitor mode, DCPS1 and DCPS3 clear SCR.NS to 0.
- In AArch64, at EL3, DCPS does not change SCR_EL3.NS.

However:

- DCPS1 is UNDEFINED at EL0 in Non-secure state if both:
  - EL2 is implemented.
  - HCR_EL2.TGE == 1.
- DCPS2 is UNDEFINED at all Exception levels if EL2 is not implemented.
- DCPS2 is UNDEFINED at the following Exception levels if EL2 is implemented:
  - At EL0 and EL1 in Secure state.
  - At EL3 if EL3 is using AArch32.
- DCPS3 is UNDEFINED at all Exception levels if either:
  - EDSCR.SDD == 1.
  - EL3 is not implemented.

`DCPS` is also defined in T32, see *DCPS1, DCPS2, DCPS3 on page F6-2670*. There is no A32 encoding.

On executing a `DCPS` instruction:

- If the target Exception level is using AArch64:
  - ELR_ELx of the target Exception level becomes UNKNOWN.
  - SPSR_ELx of the target Exception level becomes UNKNOWN.
  - ESR_ELx of the target Exception level becomes UNKNOWN.
  - DLR_EL0 and DSPSR_EL0 become UNKNOWN.
- If the target Exception level is using AArch32 DLR and DSPSR become UNKNOWN and:
  - If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.
  - If the target Exception level is EL2, then ELR_hyp, SPSR_hyp, and HSR become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.

The pseudocode for `DCPSInstruction()` is as follows:

```
// DCPSInstruction()
// =================
// Operation of the DCPS instruction in Debug state

DCPSInstruction(bits(2) target_el)

    SynchronizeContext();
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
case target_el of
    when EL1
        if PSTATE.EL == EL2 || (PSTATE.EL == EL3 && !UsingAArch32()) then handle_el = PSTATE.EL;
        elsif HaveEL(EL2) && !IsSecure() && HCR_EL2.TGE == '1' then UndefinedFault();
        else handle_el = EL1;

    when EL2
        if !HaveEL(EL2) then UndefinedFault();
        elsif PSTATE.EL == EL3 && !UsingAArch32() then handle_el = EL3;
        elsif IsSecure() then UndefinedFault();
        else handle_el = EL2;

    when EL3
        if EDSCR.SDD == '1' || !HaveEL(EL3) then UndefinedFault();
        handle_el = EL3;

if ELUsingAArch32(handle_el) then
    if PSTATE.M == M32_Monitor then SCR.NS = '0';
    assert UsingAArch32();                  // Cannot move from AArch64 to AArch32
    case handle_el of
        when EL1  AArch32.WriteMode(M32_Svc);
        when EL2  AArch32.WriteMode(M32_Hyp);
        when EL3  AArch32.WriteMode(M32_Monitor);
    if handle_el == EL2 then
        ELR_hyp = bits(32) UNKNOWN;  HSR = bits(32) UNKNOWN;
    else
        LR = bits(32) UNKNOWN;
    SPSR[] = bits(32) UNKNOWN;
    PSTATE.E = SCTLR[].EE;
else                                        // Targeting AArch64
    if UsingAArch32() then AArch64.MaybeZeroRegisterUppers();
    ELR[] = bits(64) UNKNOWN;  SPSR[] = bits(32) UNKNOWN;  ESR[] = bits(32) UNKNOWN;
    PSTATE.nRW = '0';  PSTATE.SP = '1';  PSTATE.EL = handle_el;

DLR_EL0 = bits(64) UNKNOWN;  DSPSR_EL0 = bits(32) UNKNOWN;
UpdateEDSCRFields();                        // Update EDSCR processor state flags.

return;
```

## DRPS

DRPS allows the debugger to move the PE to a lower Exception level or to another mode at the current Exception level by copying the current SPSR to PSTATE.

If DRPS is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See *Execution state* on page D1-1517.

Otherwise the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE can change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to SCTLR_ELx.EE, or SCTLR_EL1.E0E for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by SPSR.E as appropriate.

The assembler syntax for the DRPS instruction is:

```
DRPS
```

The decode can be found in the instruction description for DRPS.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If the SPSR specifies an illegal exception return, then PSTATE.{M, nRW, EL, SP} are unchanged and PSTATE.IL is set to 1. For further information on illegal exception returns, see *Illegal return events from AArch64 state* on page D1-1553.

PSTATE.{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are ignored in Debug state. This means that the effect of DRPS on these fields is to set them to an UNKNOWN value that might be the value from the SPSR. For more information see *Process state (PSTATE) in Debug state* on page H2-4832.

All other PSTATE fields are copied from SPSR.

DRPS is UNDEFINED at EL0 and in Non-debug state. In Debug state, the T32 encoding for ERET is decoded as DRPS. There is no A32 encoding for DRPS.

**Note**

Unlike an exception return, DRPS has no architecturally-defined effect on the Event Register and exclusive monitors. DRPS might set the Event Register or clear the exclusive monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

On executing a DRPS instruction:

- If the target Exception level is using AArch64:
  - DLR_EL0 and DSPSR_EL0 become UNKNOWN.
- If the target Exception level is using AArch32:
  - DLR and DSPSR become UNKNOWN.

The pseudocode for DRPSInstruction() is as follows:

```
// DRPSInstruction()
// =================
// Operation of the A64 DRPS and T32 ERET instructions in Debug state

DRPSInstruction()

    SynchronizeContext();

    SetPSTATEFromPSR(SPSR[]);

    // PSTATE.{N,Z,C,V,Q,GE,SS,D,A,I,F} are not observable and ignored in Debug state, so
    // behave as if UNKNOWN.
    if UsingAArch32() then
        PSTATE.<N,Z,C,V,Q,GE,SS,A,I,F> = bits(13) UNKNOWN;
        //  In AArch32, all instructions are T32 and unconditional.
        PSTATE.IT = '00000000';  PSTATE.T = '1';        // PSTATE.J is RES0
    else
        PSTATE.<N,Z,C,V,SS,D,A,I,F> = bits(9) UNKNOWN;
    DLR_EL0 = bits(64) UNKNOWN;  DSPSR_EL0 = bits(32) UNKNOWN;

    UpdateEDSCRFields();                                // Update EDSCR processor state flags.

    return;
```

### MRS and MSR instructions to access DLR_EL0 and DSPSR_EL0

The other Debug state instructions are MRS and MSR (register) instructions to read or write DLR_EL0 and DSPSR_EL0, and the equivalent MRC and MCR operations in AArch32 state.

```
MRS <Xt>, DLR_EL0      ; Copy DLR_EL0 to <Xt>
MRS <Xt>, DSPSR_EL0    ; Copy DSPSR_EL0 to <Xt>
MSR DLR_EL0, <Xt>      ; Copy <Xt> to DLR_EL0
MSR DSPSR_EL0, <Xt>    ; Copy <Xt> to DSPSR_EL0
```

These instructions can be executed at any Exception level when in Debug state, including EL0. They are UNDEFINED in Non-debug state.

Non-Confidential - Beta

### H2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

- *Generating exceptions when in Debug state*.
- *Taking exceptions when in Debug state*.
- *Reset in Debug state* on page H2-4854.

#### Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
  - The pending interrupt remains visible in ISR.
- Debug exceptions are ignored.
- SCR.EA is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.
- All instruction bit patterns that are an allocated instruction at the current Exception level, but listed in *Executing instructions in Debug state* on page H2-4832 as UNDEFINED in Debug state, generate Undefined Instruction exceptions, which are taken to the current Exception level, or to EL1 if executing at EL0. This includes `SVC`, `HVC`, `SMC`, `BRK`, and `HLT`. The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.
- Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:
  - Generate the appropriate trap exception taken to EL3 if EDSCR.SDD == 0.
  - Generate an Undefined Instruction exception taken to the current Exception level, or to EL1 if executing at EL0, if EDSCR.SDD == 1. If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, this is reported with an exception class of `0x00`.

  Otherwise configurable traps, enables, and disables, for instructions are unaffected by Debug state, and executing the affected instructions generates the appropriate exceptions.

Otherwise, synchronous exceptions, including Data Aborts, are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

**Note**

If EDSCR.SDD == 1 then an exception from Non-secure state is never taken to Secure state. See *Security in Debug state* on page H2-4845.

#### Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

- The target Exception level is as defined for the exception in Non-debug state.
- If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.
- The exception is reported as defined for the exception in Non-debug state, using the syndrome register or registers for the target Exception level. In AArch64, these are ESR_ELx, and FAR_ELx. In AArch32, these are DFSR, DFAR, HSR, HDFAR, and HPFAR. For example:
  - If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the DFSR reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, DFSR is not updated.

Non-Confidential - Beta

— If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as AFSR, is IMPLEMENTATION DEFINED.

- The PE remains in Debug state and changes to the target mode.
- If EL3 is using AArch32 and the exception is taken from Monitor mode, SCR.NS is cleared to 0.
- If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the System register for the target Exception level.
- The endianness switches to that indicated by the EE bit of the System register for the target Exception level.
- The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
- If the target Exception level is using AArch64, ELR_ELx for the target Exception level becomes UNKNOWN.
- If the target Exception level is EL2 using AArch32, ELR_hyp becomes UNKNOWN.
- If the target Exception level is EL1 or EL3 using AArch32, LR_<mode> for the target mode becomes UNKNOWN.
- DLR and DSPSR become UNKNOWN.
- The cumulative error flag, EDSCR.ERR, is set to 1. See *Cumulative error flag* on page H4-4895.
- PSTATE.IL is cleared to 0.
- PSTATE.{IT, T, SS, D, A, I, F} are set to UNKNOWN values, and PSTATE.{N, Z, C, V, Q, GE} are unchanged. However, these fields are ignored and are not observable in Debug state. For more information see *Process state (PSTATE) in Debug state* on page H2-4832.

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

### Pseudocode description of taking exceptions in Debug state

The pseudocode function `TakeException()` in *Pseudocode description of exception entry to AArch64 state* on page D1-1539 shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function `TakeExceptionInDebugState()`.

```
// AArch64.TakeExceptionInDebugState()
// ===================================
// Take an exception in Debug state to an Exception Level using AArch64.

AArch64.TakeExceptionInDebugState(bits(2) target_el, ExceptionRecord exception)
    assert HaveEL(target_el) && !ELUsingAArch32(target_el) && UInt(target_el) >= UInt(PSTATE.EL);

    // If coming from AArch32 state, the top parts of the X[] registers might be set to zero
    from_32 = UsingAArch32();
    if from_32 then AArch64.MaybeZeroRegisterUppers();

    AArch64.ReportException(exception, target_el);

    PSTATE.EL = target_el;  PSTATE.nRW = '0';  PSTATE.SP = '1';

    SPSR[] = bits(32) UNKNOWN;
    ELR[] = bits(64) UNKNOWN;

    // PSTATE.{SS,D,A,I,F} are not observable and ignored in Debug state, so behave as if UNKNOWN.
    PSTATE.<SS,D,A,I,F> = bits(5) UNKNOWN;
    DLR_EL0 = bits(64) UNKNOWN;
    DSPSR_EL0 = bits(32) UNKNOWN;
    PSTATE.IL = '0';
    if from_32 then                                 // Coming from AArch32
        PSTATE.IT = '00000000';  PSTATE.T = '0';    // PSTATE.J is RES0
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    EDSCR.ERR = '1';
    UpdateEDSCRFields();                        // Update EDSCR processor state flags.
    EndOfInstruction();
```

The pseudocode functions EnterMode(), EnterHypMode(), and EnterMonitorMode() in *Additional pseudocode functions for exception handling* on page G1-3829 show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state, EnterMode() is replaced with the function EnterModeInDebugState().

```
// AArch32.EnterModeInDebugState()
// ===============================
// Take an exception in Debug state to a mode other than Monitor and Hyp mode.

AArch32.EnterModeInDebugState(bits(5) target_mode)
    assert ELUsingAArch32(EL1) && PSTATE.EL != EL2;

    if PSTATE.M == M32_Monitor then SCR.NS = '0';
    AArch32.WriteMode(target_mode);
    SPSR[] = bits(32) UNKNOWN;
    R[14] = bits(32) UNKNOWN;
    // In Debug state, the PE always execute T32 instructions when in AArch32 state, and
    // PSTATE.{SS,A,I,F} are not observable so behave as UNKNOWN.
    PSTATE.T = '1';                             // PSTATE.J is RES0
    PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
    DLR = bits(32) UNKNOWN;
    DSPSR = bits(32) UNKNOWN;
    PSTATE.E = SCTLR.EE;
    PSTATE.IL = '0';
    PSTATE.IT = '00000000';
    EDSCR.ERR = '1';
    UpdateEDSCRFields();                        // Update EDSCR processor state flags.
    EndOfInstruction();
```

In Debug state, EnterHypMode() is replaced with the function EnterHypModeInDebugState().

```
// AArch32.EnterHypModeInDebugState()
// ==================================
// Take an exception in Debug state to Hyp mode.

AArch32.EnterHypModeInDebugState(ExceptionRecord exception)
    assert HaveEL(EL2) && !IsSecure() && ELUsingAArch32(EL2);

    AArch32.ReportHypEntry(exception);
    AArch32.WriteMode(M32_Hyp);
    SPSR[] = bits(32) UNKNOWN;
    ELR_hyp = bits(32) UNKNOWN;
    // In Debug state, the PE always execute T32 instructions when in AArch32 state, and
    // PSTATE.{SS,A,I,F} are not observable so behave as UNKNOWN.
    PSTATE.T = '1';                             // PSTATE.J is RES0
    PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
    DLR = bits(32) UNKNOWN;
    DSPSR = bits(32) UNKNOWN;
    PSTATE.E = HSCTLR.EE;
    PSTATE.IL = '0';
    PSTATE.IT = '00000000';
    EDSCR.ERR = '1';
    UpdateEDSCRFields();
    EndOfInstruction();
```

In Debug state, EnterMonitorMode() is replaced with EnterMonitorModeInDebugState().

```
// AArch32.EnterMonitorModeInDebugState()
// ======================================
// Take an exception in Debug state to Monitor mode.

AArch32.EnterMonitorModeInDebugState()
    assert HaveEL(EL3) && ELUsingAArch32(EL3);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
if PSTATE.M == M32_Monitor then SCR.NS = '0';
AArch32.WriteMode(M32_Monitor);
SPSR[] = bits(32) UNKNOWN;
R[14] = bits(32) UNKNOWN;
// In Debug state, the PE always execute T32 instructions when in AArch32 state, and
// PSTATE.{SS,A,I,F} are not observable so behave as UNKNOWN.
PSTATE.T = '1';                              // PSTATE.J is RES0
PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
DLR = bits(32) UNKNOWN;
DSPSR = bits(32) UNKNOWN;
PSTATE.E = SCTLR.EE;
PSTATE.IL = '0';
PSTATE.IT = '00000000';
EDSCR.ERR = '1';
UpdateEDSCRFields();                         // Update EDSCR processor state flags.
EndOfInstruction();
```

### Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, EDSCR.STATUS == `0b000010` and writes to EDITR are ignored.

**Note**

If EDECR.RCE == 1, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See *Reset Catch debug events* on page H3-4880. All PE registers have taken their reset values, which might be UNKNOWN.

## H2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

### General-purpose register access, other than SP access in AArch64 state

A single general-purpose register can be read by issuing an `MSR` instruction through the ITR to write DBGDTR_EL0 in AArch64 state, or an `MCR` instruction through the ITR to write DBGDTRTXint in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

Figure H2-1 on page H2-4855 shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.

*Non-Confidential - Beta*

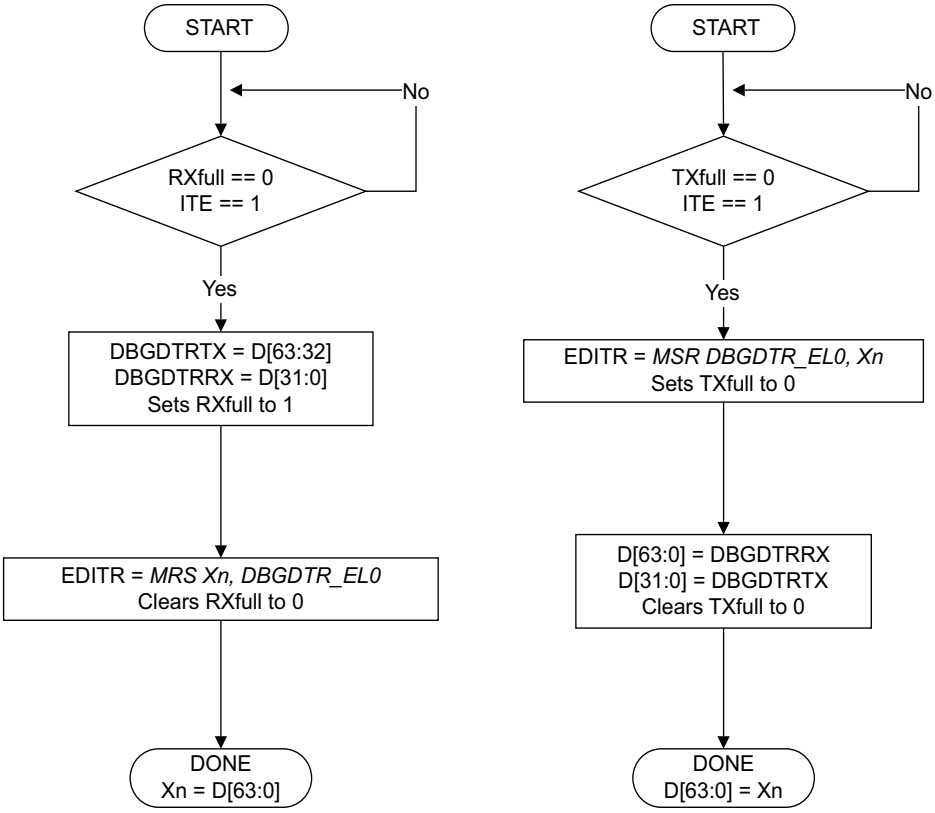

**Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

Figure H2-2 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.

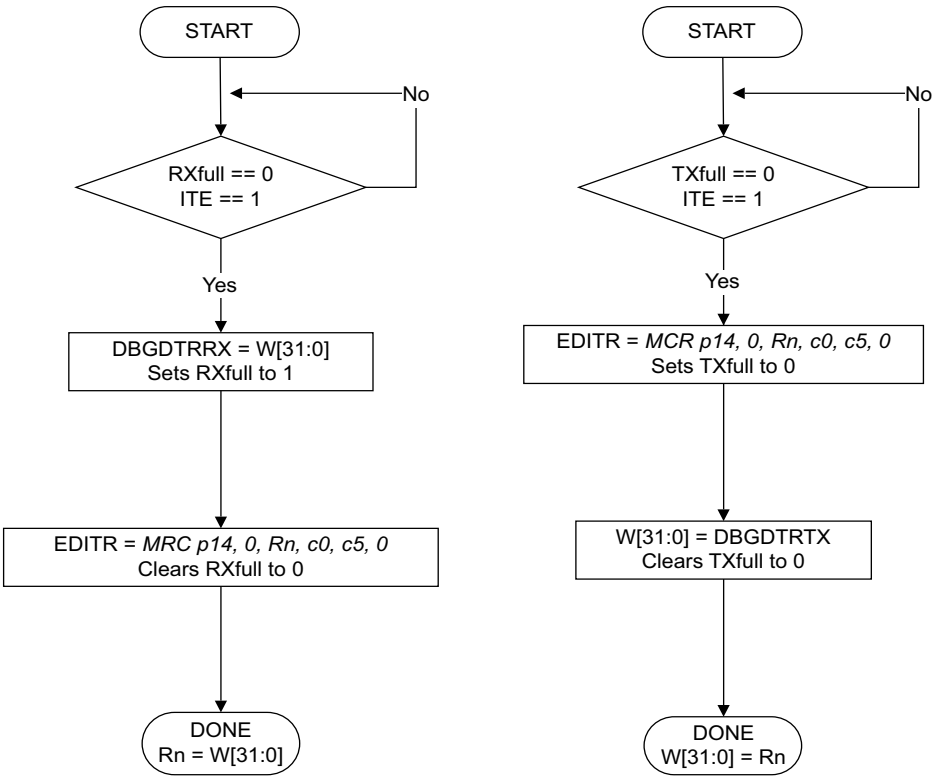

**Figure H2-2 Reading and writing general-purpose registers in Debug state in AArch32 state**

### SIMD and floating-point register, System register, and SP access in AArch64 state

To read a SIMD and floating-point register or a System register, the debugger must first copy the value into a general-purpose register using:

- An `FMOV` instruction in AArch64 or a `VMOV` instruction in AArch32 for floating-point transfers to SIMD and FP registers.
- A `UMOV` instruction in AArch64 or a `VMOV` instruction in AArch32 for SIMD transfers to SIMD and FP registers.
- An `MRS` instruction in AArch64 or an `MRC` instruction in AArch32 for System registers.
- A `MOV Xd,SP` instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

### PC and PSTATE access

The debugger reads the program counter and PSTATE of the process being debugged through the DLR_EL0 and DSPSR_EL0 System registers. The actual values of PC and PSTATE cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and PSTATE in Non-debug state are UNDEFINED in Debug state.
- On taking an exception, ELR_ELx and SPSR_ELx at the target exception level are UNKNOWN. They do not record the PC and PSTATE.

PSTATE.{IL, E, M, nRW, EL, SP} are indirectly read by instructions executed in Debug state, but all other PSTATE fields are ignored and cannot be observed. See also:

- *Process state (PSTATE) in Debug state* on page H2-4832.
- *Executing instructions in Debug state* on page H2-4832.
- *Exceptions in Debug state* on page H2-4851.

Non-Confidential - Beta

### H2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

#### Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. *Executing instructions in Debug state* on page H2-4832 lists the memory access instructions that are supported in Debug state.

#### Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See *DCC and ITR access modes* on page H4-4889.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If EDSCR.ITE == 0 the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

**Note**

- Implementations can set EDSCR.ITE to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and EDSCR.ITE == 1, then the PE must complete these instructions in Debug state before executing the restart sequence. EDSCR.ITE == 0 indicates that the PE is not ready to restart.
- A debugger must observe that any instructions issued through EDITR that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the EDSCR.{TXfull, RXfull} flags.

On exiting Debug state, the PE sets the program counter to the address in DLR, where:

- If exiting to AArch32 state:
  - Bits[63:32] of DLR are ignored.
  - Bits[31:1] of the PC are set to the value of bits[31:1] of DLR.
  - Bit[0] of the PC is set to a CONSTRAINED UNPREDICTABLE choice of 0 or the value of bit[0] in DLR.
- If exiting to AArch64 state:
  - Bits[63:56] of DLR_EL0[31:0] might be ignored as part of tagged address handling. See *Address tagging in AArch64 state* on page D4-1742.
  - Otherwise the PC is set from DLR_EL0[31:0].

Exit from Debug state can give rise to a misaligned PC exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see *PC alignment checking* on page D1-1531.

On exiting Debug state, PSTATE is set from DSPSR in the same way that an exception return sets PSTATE from SPSR_ELx:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on PSTATE and the PC is the same as for any other illegal exception return. See *Exception return* on page D1-1552 and *Exception return to an Exception level using AArch32* on page G1-3796.
- The checks on the PSTATE.IT bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- PSTATE.SS is copied from DSPSR.SS if all of the following hold:
  - MDSCR_EL1.SS == 1.
  - The debug target Exception level is using AArch64.
  - Software step exceptions from the restart Exception level are enabled.

  Otherwise PSTATE.SS is set to 0.

  **Note**

  Unlike a return using ERET, PSTATE.SS must be restored from DSPSR.SS because otherwise it is UNKNOWN.

  However, if OSDLR.DLK == 1 and DBGPRCR.CORENPDRQ == 0, meaning the OS Double Lock is locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether PSTATE.SS is copied from DSPSR.SS.

**Note**

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example, PSTATE.{D, A, I, F} is updated regardless of the value of SCTLR_EL1.UMA.
- Exit from Debug state has no architecturally-defined effect on the Event Register and exclusive monitors. An exit from Debug state might set the Event Register or clear the exclusive monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

The pseudocode for ExitDebugState() is as follows.

```
// ExitDebugState()
// ================

ExitDebugState()
    assert Halted();
    SynchronizeContext();

    // Although EDSCR.STATUS signals that the processor is restarting, debuggers must use EDPRSR.SDR
    // to detect that the processor has restarted.
    EDSCR.STATUS = '000001';                            // Signal restarting
    EDESR<2:0> = '000';                                 // Clear any pending Halting debug events

    new_pc = DLR_EL0;
    spsr = DSPSR;

    // If this is an illegal return, SetPSTATEFromPSR() will set PSTATE.IL.
    SetPSTATEFromPSR(spsr);                             // Can update privileged bits, even at EL0.

    if UsingAArch32() then
        if ConstrainUnpredictableBool() then new_pc<0> = '0';
        BranchTo(new_pc<31:0>, BranchType_UNKNOWN);     // AArch32 branch
    else
        // If targeting AArch32 then possibly zero the 32 most significant bits of the target PC
        if spsr<4> == '1' && ConstrainUnpredictableBool() then
            new_pc<63:32> = Zeros();
        BranchTo(new_pc, BranchType_DBGEXIT);           // A type of branch that is never predicted

    (EDSCR.STATUS,EDPRSR.SDR) = ('000010','1');         // Atomically signal restarted
    UpdateEDSCRFields();                                // Stop signalling processor state.
    DisableITRAndResumeInstructionPrefetch();

    return;
```

# Chapter H3
# Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- *Introduction to Halting debug events* on page H3-4862.
- *Halting Step debug events* on page H3-4864.
- *Halt Instruction debug event* on page H3-4874.
- *Exception Catch debug event* on page H3-4875.
- *External Debug Request debug event* on page H3-4878.
- *OS Unlock Catch debug event* on page H3-4879.
- *Reset Catch debug events* on page H3-4880.
- *Software Access debug event* on page H3-4881.
- *Synchronization and Halting debug events* on page H3-4882.

**Note**

Table K13-1 on page K13-5708 disambiguates the general register references used in this chapter.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available in ARMv8:

- *Halting Step debug events* on page H3-4864.
- *Halt Instruction debug event* on page H3-4874.
- *Exception Catch debug event* on page H3-4875.
- *External Debug Request debug event* on page H3-4878.
- *OS Unlock Catch debug event* on page H3-4879.
- *Reset Catch debug events* on page H3-4880.
- *Software Access debug event* on page H3-4881.

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See *Breakpoint and Watchpoint debug events* on page H2-4822. Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see Chapter H2 *Debug State*. For a definition of halting allowed, see *Halting allowed and halting prohibited* on page H2-4821.

*Debug state entry and debug event prioritization* on page H2-4823 describes the behavior when multiple debug events are generated by an instruction.

See also *Synchronization and Halting debug events* on page H3-4882.

Table H3-1 shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

**Table H3-1 Summary of debug events and possible outcomes**

| Debug event type | PE behavior when halting is: | |
|---|---|---|
| | Allowed | Prohibited |
| *Breakpoint and Watchpoint debug events* on page H2-4822 | Halt | See Table D2-1 on page D2-1639 and Table G2-1 on page G2-3885 |
| *Halt Instruction debug event* on page H3-4874 | Halt | UNDEFINED |
| *Software Access debug event* on page H3-4881 | Halt | Ignored |
| *Exception Catch debug event* on page H3-4875 | Halt | Ignored |
| *Halting Step debug events* on page H3-4864 | Halt | Pended |
| *External Debug Request debug event* on page H3-4878 | Halt | Pended |
| *Reset Catch debug events* on page H3-4880 | Halt | Pended |
| *OS Unlock Catch debug event* on page H3-4879 | Pended | Pended |

Table H3-2 shows where the pseudocode for each Halting debug event type is located.

**Table H3-2 Pseudocode description of Halting debug events**

| Halting debug event type | Pseudocode |
|---|---|
| *Halt Instruction debug event* on page H3-4874 | *HLT* on page C6-531 for AArch64 and *HLT* on page F6-2685 for AArch32 |
| *Software Access debug event* on page H3-4881 | *Pseudocode description of Software Access debug event* on page H3-4881 |
| *Exception Catch debug event* on page H3-4875 | *Pseudocode description of Exception Catch debug events* on page H3-4877 |
| *Halting Step debug events* on page H3-4864 | *Pseudocode description of Halting Step debug events* on page H3-4873 |

## H3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- *Overview of a Halting Step debug event*.
- *The Halting Step state machine*.
- *Using Halting Step* on page H3-4867.
- *Detailed Halting Step state machine behavior* on page H3-4867.
- *Synchronization and the Halting Step state machine* on page H3-4870.
- *Stepping T32 IT instructions* on page H3-4871.
- *Disabling interrupts while stepping* on page H3-4872.
- *Syndrome information on Halting Step* on page H3-4872.
- *Pseudocode description of Halting Step debug events* on page H3-4873.

The architecture describes the behavior as a simple Halting Step state machine. See *The Halting Step state machine*.

### H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in Figure H3-1 on page H3-4866. A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, EDECR.SS and EDESR.SS.

**Note**

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

### H3.2.2 The Halting Step state machine

The state machine states are:

**Inactive** Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:

- Halting Step is disabled. That is, EDECR.SS is set to 0 and EDESR.SS is set to 0.
- Halting is prohibited. See *Halting the PE on debug events* on page H2-4821.

In Figure H3-1 on page H3-4866 this state is shown in red.

**Active-not-pending**

Halting Step is enabled and active. This is the state in which the PE steps an instruction. EDECR.SS == 1 and EDESR.SS == 0. A debugger must only set EDECR.SS to 1 when the PE is in Debug state.

In Figure H3-1 on page H3-4866 this state is shown in green.

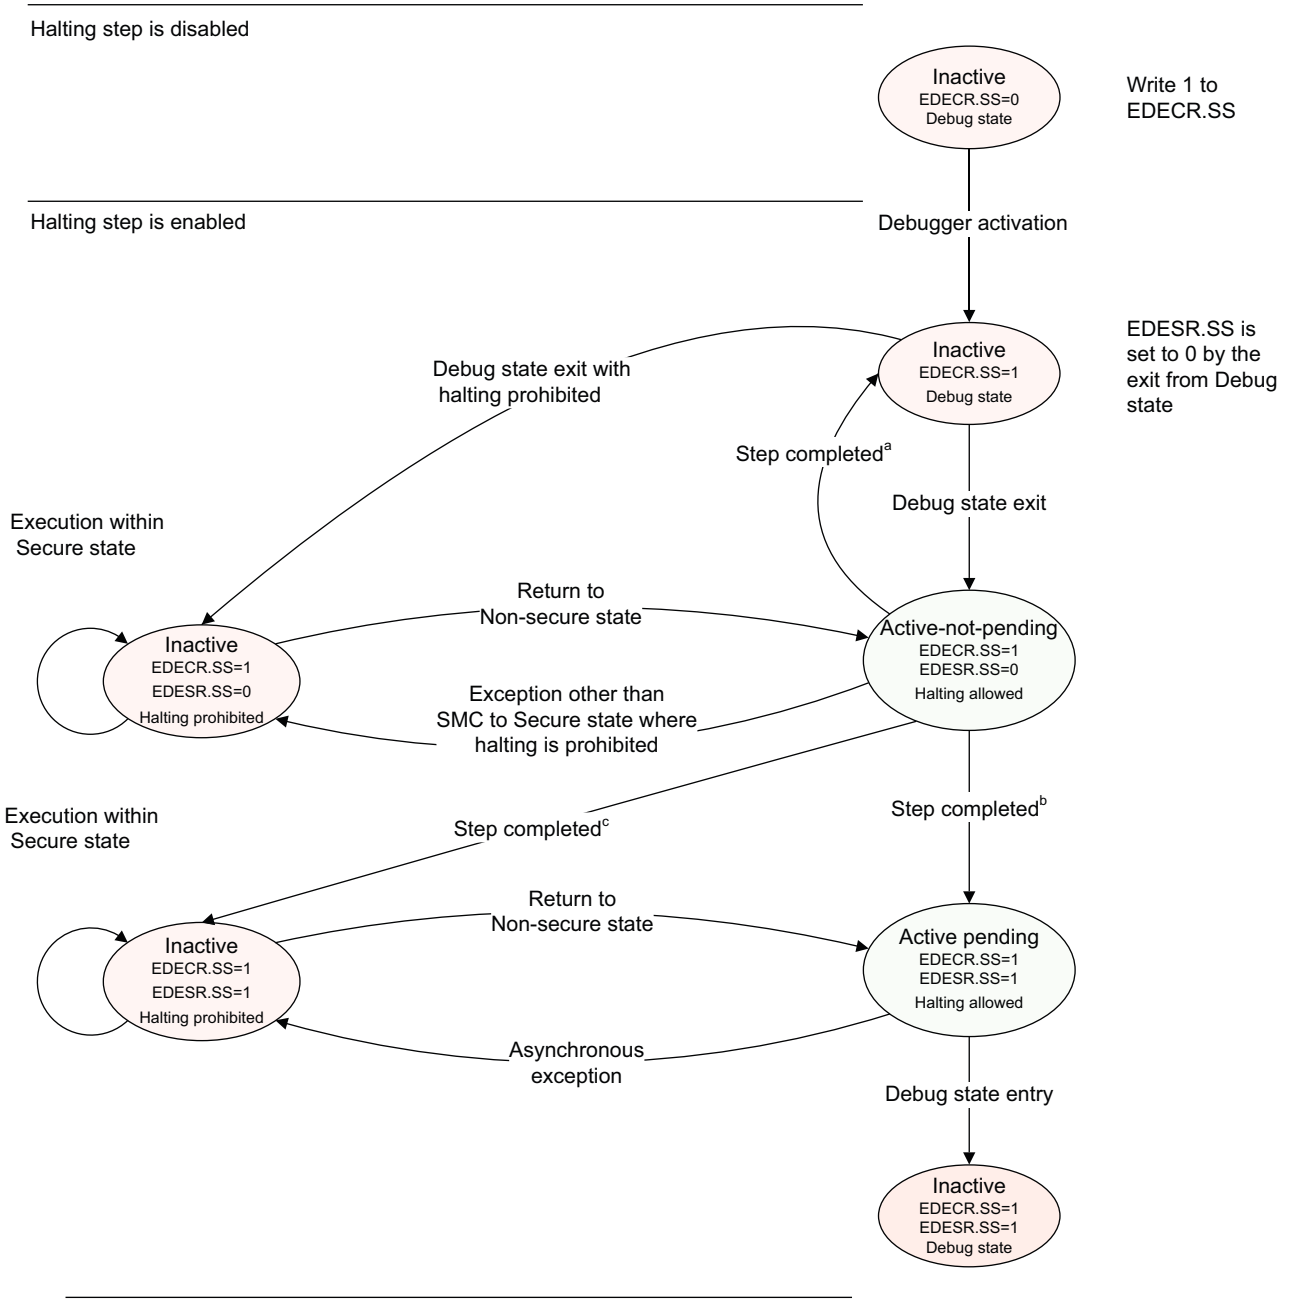
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Active-pending**

Halting Step is enabled and active. The step has completed, and the PE enters Debug state. EDESR.SS == 1.

In Figure H3-1 on page H3-4866 this state is shown in green.

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on EDESR.SS. *Halting Step state machine states* on page H3-4867 shows this.



In the simple sequential execution of the program the PE executes the Halting Step state machine, as follows:

1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

Figure H3-1 on page H3-4866 shows a Halting Step state machine.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

a. Step completed occurs when:
   - A debug event, other than a Halting Step debug event, causes entry into Debug state.

b. Step completed occurs when:
   - An instruction is executed without taking an exception.
   - An exception is taken to a state where halting is allowed.
   - A reset.

c. Step completed occurs when:
   - An SMC exception is taken to Secure state where halting is prohibited.

**Figure H3-1 Halting Step state machine**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Note**

Figure H3-1 on page H3-4866 only describes state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as EDECR and OSDLR and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE behavior. See *Synchronization and the Halting Step state machine* on page H3-4870.

The following bits control the state machine, as shown in Table H3-3:

- EDECR.SS. This is the Halting Step enable bit.

  **Note**

  — The EDECR value is preserved over powerdown, meaning that the step active state is maintained over a powerdown event.

  — A debugger must only set EDECR.SS to 1 when the PE is in Debug state.

- EDESR.SS.

Table H3-3 shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

**Table H3-3 Halting Step state machine states**

| Halting | EDECR.SS | EDESR.SS | Halting Step state |
|---|---|---|---|
| Prohibited | X | X | Inactive |
| Allowed | 0 | 0 | Inactive |
| Allowed | 1 | 0 | Active-not-pending |
| Allowed | X | 1 | Active-pending |

### H3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:

1. The debugger sets EDECR.SS to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with DLR set to the address of the instruction being stepped. The PE clears EDESR.SS to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped.

   If an exception is taken to a state where halting is prohibited, then EDESR.SS is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

### H3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- *Entering the active-not-pending state* on page H3-4868.
- *PE behavior in the active-not-pending state* on page H3-4868.
- *Entering the active-pending state* on page H3-4869.
- *PE behavior in the inactive state when in Non-debug state* on page H3-4870.
- *PE behavior in Debug state* on page H3-4870.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Entering the active-not-pending state

The PE enters the active-not-pending state:

- By exiting Debug state with EDECR.SS == 1.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with EDECR.SS == 1 and EDESR.SS == 0.
- As described in *Synchronization and the Halting Step state machine* on page H3-4870.

### PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:

- It executes one instruction and does one of the following:
  - Completes it without generating a synchronous exception.
  - Generates a synchronous exception.
  - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without executing any instruction.
- It takes an asynchronous debug event into Debug state.

#### *If no exception or debug event is generated*

If no exception or debug event is generated the PE sets EDESR.SS to 1. This means that the Halting Step state machine advances to the active-pending state.

#### *If an exception or debug event is generated*

The PE sets EDESR.SS according to all of the following:

- The type of exception.
- The target Exception level of the exception.
- If the exception is taken to Secure state, whether halting is prohibited in Secure state.
  - This is determined by the result of `ExternalSecureInvasiveDebugEnabled()`.

If an exception or debug event is generated, the PE sets EDESR.SS to 1 if one of the following applies:

- A synchronous exception is generated by the instruction and one of the following applies:
  - The exception is taken to EL1 or EL2.
  - The exception is not an SMC exception and `ExternalSecureInvasiveDebugEnabled()` == TRUE.
  - The exception is an SMC exception.
- An asynchronous exception is generated before executing an instruction and this is either:
  - Taken to EL1 or EL2.
  - Taken to EL3 and `ExternalSecureInvasiveDebugEnabled()` == TRUE.
- A PE reset occurs.

Otherwise EDESR.SS is unchanged. This happens when:

- No instruction is executed because either:
  - An asynchronous exception is taken to EL3 and `ExternalSecureInvasiveDebugEnabled()` == FALSE.
  - An asynchronous debug event causes entry to Debug state.
- An instruction is executed and either:
  - Generates a synchronous exception other than an SMC exception which is taken to EL3, and `ExternalSecureInvasiveDebugEnabled()` == FALSE.
  - Generates a synchronous debug event and causes entry to Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise the Halting Step state machine advances to the active-pending state.

**Note**

The underlying criteria for the value of EDESR.SS on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

Table H3-4 shows the behavior of the active-not-pending state. The letter X indicates that `ExternalSecureInvasiveDebugEnabled()` can be either TRUE or FALSE.

**Table H3-4 Summary of active-not-pending state behavior**

| Event | Target Exception level | `ExternalSecureInvasiveDebugEnabled()` | Value written to EDESR.SS |
|---|---|---|---|
| No exception or debug event | Not applicable | X | 1 |
| SMC exception | EL3 | X | 1 |
| Reset | Highest | X | 1 |
| Exception, other than SMC exception | EL1 | X | 1 |
| | EL2 | X | 1 |
| | EL3 | TRUE | 1 |
| | | FALSE | Unchanged |
| Debug event | Debug state | X | Unchanged |

### Entering the active-pending state

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
  - Executing an instruction without taking an exception.
  - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when EDESR.SS == 1.

  **Note**

  That is, an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled()` == FALSE to Non-secure state with `ExternalInvasiveDebugEnabled()` == TRUE.
- A reset when the value of EDECR.SS == 1, regardless of the state the PE was in before the reset occurred.
- Following the description in *Synchronization and the Halting Step state machine* on page H3-4870.

When the PE is in the active-pending state, it enters Debug state before executing an instruction. However, if `ExternalSecureInvasiveDebugEnabled()` == FALSE, the architecture does not define the prioritization of this Debug state entry with respect to any pending asynchronous exception that is taken from Non-secure state to EL3.

If an exception is prioritized over the halt, then EDESR.SS is unchanged. On return from the exception the Halting Step state machine re-enters the active-pending state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The entry into Debug state has higher priority than all other types of exception, including all other asynchronous exceptions.

**Note**

This means that it is possible to step a reentrant exception in the exception vector table.

### PE behavior in the inactive state when in Non-debug state

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which is a *Context synchronization operation*.

See also *Synchronization and the Halting Step state machine*.

### PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see *Halting allowed and halting prohibited* on page H2-4821.

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS == 1, Halting Step enters the active-not-pending state.

**Note**

This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in *PE behavior in the active-not-pending state* on page H3-4868, because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS == 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

## H3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
  - The security state changes without an exception return. See *State and mode changes without explicit context synchronization operations* on page G2-3946.
  - The external authentication interface changes.
  - The OS Double Lock status, `DoubleLockStatus()`, changes.
- A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.
- A write to EDESR when the PE is in Non-debug state clears EDESR.SS to 0.

These operations are guaranteed to take effect only after a *Context synchronization operation*.

The PE must perform the required behavior of the new state before or immediately following the next *Context synchronization operation*, but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next *Context synchronization operation*. This is illustrated in Example H3-1 on page H3-4871 and Example H3-2 on page H3-4871.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Example H3-1 Synchronization requirements 1**

EDECR.SS is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. `ExternalSecureInvasiveDebugEnabled()` == FALSE, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. EDESR.SS remains set to 0. If `ExternalSecureInvasiveDebugEnabled()` subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next *Context synchronization operation*, but it is not required to do so immediately.

**Example H3-2 Synchronization requirements 2**

EDECR.SS is set to 1 in Debug state. On exit from Debug the PE executes an `MSR` instruction that sets OSDLR_EL1.DLK to 1 and `DoubleLockStatus()` becomes TRUE. This change requires a *Context synchronization operation* to guarantee its effect, meaning it is CONSTRAINED UNPREDICTABLE whether:

- Halting is allowed:
  - The PE enters Debug state on the next instruction.
- Halting is prohibited:
  - The PE does not enter Debug state.

The value in EDESR.SS depends on whether halting was allowed or prohibited when the write to OSDLR_EL1.DLK completed, and so it might be 0 or 1. If a second `MSR` instruction clears OSDLR_EL1.DLK to 0, the PE must perform the required behavior of the state indicated by EDESR.SS before or immediately following the next *Context synchronization operation*, but it is not required to do so immediately.

See also *Synchronization and Halting debug events* on page H3-4882.

### H3.2.6 Stepping T32 `IT` instructions

In an implementation that supports the ITD control, the architecture permits a combination of one T32 `IT` instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is IMPLEMENTATION DEFINED whether:

- The PE considers such a pair of instructions to be one instruction.
- The PE considers such a pair of instructions be two instructions.

It is IMPLEMENTATION DEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

**HSCTLR.ITD** Applies to execution at EL2 when EL2 is using AArch32.

**SCTLR.ITD** Applies to execution at EL0 or EL1 when EL1 is using AArch32.

**SCTLR_EL1.ITD**
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

### H3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting EDSCR.INTdis, to allow the code being debugged to make forward progress.

### H3.2.8 Syndrome information on Halting Step

Three EDSCR.STATUS encodings record different scenarios for entering Debug state on a Halting Step debug event:

**Halting Step, normal**

An instruction other than a Load-Exclusive instruction was stepped.

**Halting Step, exclusive**

A Load-Exclusive instruction was stepped.

**Halting Step, no syndrome**

The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, EDSCR.STATUS is set to either:

- Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

If the stepped instruction was a conditional Load-Exclusive instruction that failed its condition code test, EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, EDSCR.STATUS is set to Halting Step, no syndrome. This happens when:

- The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
- The active-pending state is entered for other reasons. See *Synchronization and the Halting Step state machine on page H3-4870*

In addition, EDSCR.STATUS is set to one of a CONSTRAINED UNPREDICTABLE choice if:

- The instruction being stepped generated a synchronous exception, or a pending asynchronous exception was taken before the instruction was executed.

  In this case EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of:

  — Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.

  — Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

- The instruction that was stepped was an exception return instruction or an `ISB`. As these instructions are not in the Load-Exclusive instructions, EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
- The PE enters directly into the active-pending state on reset because EDECR.SS is set to 1. EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.

In all cases, if EDSCR.STATUS is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting EDSCR.STATUS to Halting Step, normal or Halting Step, exclusive.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

In an implementation that always sets EDSCR.STATUS to Halting Step, no syndrome is not compliant.

### H3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `RunHaltingStep()`. This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if EDECR.RCE == 1. `RunHaltingStep()` affects the next instruction.
- `CheckHaltingDebugStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.

```
// RunHaltingStep()
// ================

RunHaltingStep(boolean exception_generated, bits(2) exception_target, boolean syscall,
               boolean reset)
    // "exception_generated" is TRUE if the previous instruction generated a synchronous exception
    // or was cancelled by an asynchronous exception.
    // if "exception_generated" == TRUE then "exception_target" is the target of the exception, and
    // "syscall" is TRUE if the exception is a synchronous exception where the preferred return
    // address is the instruction following that which generated the exeception.
    // "reset" = TRUE if exiting reset state into the highest EL.
    if reset then assert !Halted();             // Cannot come out of reset halted

    active = EDECR.SS == '1' && !Halted();

    if active && reset then                     // Coming out of reset with EDECR.SS set.
        EDESR.SS = '1';
    elsif active && HaltingAllowed() then
        if exception_generated && exception_target == EL3 then
            advance = syscall || ExternalSecureInvasiveDebugEnabled();
        else
            advance = TRUE;
        if advance then EDESR.SS = '1';

    return;

// CheckHaltingStep()
// ==================
// Check whether EDESR.SS has been set by Halting Step

CheckHaltingStep()
    if HaltingAllowed() && EDESR.SS == '1' then
        // The STATUS code depends on how we arrived at the state where EDESR.SS == 1.
        if HaltingStep_DidNotStep() then
            Halt(DebugHalt_Step_NoSyndrome);
        elsif HaltingStep_SteppedEX() then
            Halt(DebugHalt_Step_Exclusive);
        else
            Halt(DebugHalt_Step_Normal);
```

## H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when EDSCR.HDE == 1, halting is allowed, and software executes the Halting software breakpoint instruction, HLT.

The pseudocode for Halt Instruction Debug events is described in *HLT* on page C6-531 for A64 and *HLT* on page F6-2685 for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if EDSCR.HDE == 0, or if halting is prohibited.

**Note**

A debugger can replace a program instruction with a Halt instruction to generate a Halting Software Breakpoint. Debuggers that use the HLT instruction must be aware of the ARMv8-A rules for concurrent modification of executable code, CMODX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See *Concurrent modification and execution of instructions* on page B2-82.

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as UNDEFINED. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the condition code field is not 0b1110, with the set of behaviors the same as for BKPT. See Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

**Note**

The HLT instruction is part of the external debug solution for ARMv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 CP15 register ID_ISAR0.Debug does not indicate the presence of the HLT instruction.

### H3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 HLT instruction cannot be combined with an IT instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

- If the value of the ITD field is 1, then the combination is treated as UNDEFINED and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.
- If the value of the ITD field is 0, then the HLT instruction either:
  - Is treated as UNDEFINED and generates an Undefined Instruction exception.
  - Generates an HLT Instruction debug event.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an HLT Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

The ITD control fields are:

**HSCTLR.ITD** Applies to execution at EL2 when EL2 is using AArch32.

**SCTLR.ITD** Applies to execution at EL0 or EL1 when EL1 is using AArch32.

**SCTLR_EL1.ITD**
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

**Note**

An HLT instruction is always unconditional, even within an IT block.

Non-Confidential - Beta

## H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, EDECCR, is set to 1 on all entries to a given Exception level. This means:
  - Exceptions taken to the Exception level.
  - Exception returns to the Exception level.
  - Entry to the Exception level due to reset. This is an overlap with a Reset Catch debug event. See *Reset Catch debug events* on page H3-4880.
- Are taken synchronously, after entry to the Exception level.
- Ignore the Execution state of the target Exception level.
- Are ignored if halting is prohibited.

The EDECCR contains two fields:

- One field for Non-secure state.
- One field for Secure state.

Each field contains one bit for each Exception level in that state. Bits corresponding to Exception levels that are not implemented are RES0. See *EDECCR, External Debug Exception Catch Control Register* on page H9-5008.

**Note**

- EDECCR does not replace DBGVCR:
  - DBGVCR is retained in AArch32 state for backwards compatibility.
  - DBGVCR is ignored in AArch64 state and never generates entries to Debug state.
  - DBGVCR cannot be accessed by the external debug interface.
- EDECCR is only visible as OSECCR_EL1 by System Register instructions in AArch64 state, and as DBGOSECCR by CP14 register access instructions in AArch32 state, when the OS Lock is locked to allow software to save and restore it over a powerdown.
- Exception Catch debug events are not disabled when the OS Lock is locked.

For an Exception Catch debug event generated after taking an exception to a trapped Exception level:

- The PE must not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.
- On entering Debug state:
  - The current Exception level is the target Exception level of the exception.
  - The ELR, SPSR, ESR, and other syndrome registers contain information about the exception.
  - DLR contains the exception vector address.

### H3.4.1 Prioritization of Exception Catch debug events

The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than each of Software Step exceptions and Halting Step debug events.
- Exception Catch debug events are higher priority than all synchronous exceptions other than Software Step exceptions.
- Exception Catch debug events are lower priority than Reset Catch debug events.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

As described in *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See *Vector Catch exceptions* on page D2-1685 or *Vector Catch exceptions* on page G2-3937.

A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

See also *Debug state entry and debug event prioritization* on page H2-4823.

### H3.4.2 UNPREDICTABLE generation of Exception Catch debug events

When the PE is executing code at a given Exception level and the corresponding EDECCR bit is 1, it is CONSTRAINED UNPREDICTABLE whether an Exception Catch debug event is generated.

**Note**

It is possible to generate Exception Catch debug events:

- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in *Detailed Halting Step state machine behavior* on page H3-4867.

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an `ISB` operation executed at the Exception level.

Examples of this are:

- If the debugger writes to EDECCR so that the current Exception level is trapped.
- If the OS restore code writes to OSECCR so that the current Exception level is trapped.
- If the code executing in AArch32 state changes the Exception level or security state other than by an exception return, and the target Exception level is trapped. See *State and mode changes without explicit context synchronization operations* on page G2-3946.

### H3.4.3 Examples of Exception Catch debug events

If EDECCR == `0x20`, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:

- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:

- ELR_EL1 and SPSR_EL1 are written with the preferred return address and PE state for a return to EL0.
- ESR_EL1 and FAR_EL1 are written with the syndrome information for the exception.
- DLR_EL0 is set to VBAR_EL1 + `0x400`, the synchronous exception vector.
- DSPSR_EL0 is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:

- An exception taken from Non-secure EL0 to EL2 or EL3.
- An exception return from EL2 to Non-secure EL0.
- An exception taken from Secure EL0 to Secure EL1.
- An exception return from EL3 to Secure EL1.

Non-Confidential - Beta

### H3.4.4 Pseudocode description of Exception Catch debug events

The pseudocode for the CheckExceptionCatch() function is as follows:

```
// CheckExceptionCatch()
// =====================
// Check whether an Exception Catch debug event is set on the current Exception level

CheckExceptionCatch()
    // Called after taking an exception, that is, such that IsSecure() and PSTATE.EL are correct
    // for the exception target.
    base = if IsSecure() then 0 else 4;
    if HaltingAllowed() && EDECCR<UInt(PSTATE.EL) + base> == '1' then
        Halt(DebugHalt_ExceptionCatch);
```

Non-Confidential - Beta

## H3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See Chapter H5 *The Embedded Cross-Trigger Interface*.

**Note**

ARMv8-A requires the implementation of an embedded cross-trigger.

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

If an External Debug Request debug event is being asserted at the point where a reset is taken, then the PE enters Debug state before it completes execution of the first instruction following the reset, provided that the state into which the PE resets allows halting.

### H3.5.1 Pseudocode description of External Debug Request debug events

The pseudocode for the `ExternalDebugRequest()` function is as follows:

```
// ExternalDebugRequest()
// ======================

ExternalDebugRequest()
    if HaltingAllowed() then
        Halt(DebugHalt_EDBGRQ);
    // Otherwise the CTI continues to assert the debug request until it is taken.
```

## H3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when EDECR.OSUCE == 1 and the state of the OS Lock changes from locked to unlocked.

When the OS Unlock Catch debug event is generated, it is recorded by setting EDESR.OSUC to 1, meaning it immediately becomes pending. However, it is not guaranteed to be taken immediately. See *Synchronization and Halting debug events* on page H3-4882.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also:

- *Debug behavior when the OS Lock is unlocked* on page H6-4932.
- *EDECR, External Debug Execution Control Register* on page H9-5010.
- *EDESR, External Debug Event Status Register* on page H9-5012.

EDESR.OSUC is cleared to 0 on a Warm reset and on exiting Debug state.

### H3.6.1 Using the OS Unlock Catch debug event

If the debugger attempts to access a debug register when the Core power down domain is completely off or in a low-power state in which the core power domain registers cannot be accessed, and that access returns an error, then the debugger must retry the access. However, if the Core power domain is regularly powered down, this can lead to unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in *Debug OS Save and Restore sequences* on page H6-4930, then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

### H3.6.2 Pseudocode description of OS Unlock Catch debug event

The `CheckOSUnlockCatch()` function is called when the OS Lock is unlocked.

```
// CheckOSUnlockCatch()
// ====================
// Called on unlocking the OS Lock to pend an OS Unlock Catch debug event

CheckOSUnlockCatch()
    if EDECR.OSUCE == '1' && !Halted() then EDESR.OSUC = '1';
```

The `CheckPendingOSUnlockCatch()` function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.

```
// CheckPendingOSUnlockCatch()
// ===========================
// Check whether EDESR.OSUC has been set by an OS Unlock Catch debug event

CheckPendingOSUnlockCatch()
    if HaltingAllowed() && EDESR.OSUC == '1' then
        Halt(DebugHalt_OSUnlockCatch);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H3.7 Reset Catch debug events

A Reset Catch debug event is generated when EDECR.RCE == 1 and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting EDESR.RC to 1.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, DLR has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See also:

- *Synchronization and Halting debug events* on page H3-4882.
- *EDECR, External Debug Execution Control Register* on page H9-5010.
- *EDESR, External Debug Event Status Register* on page H9-5012.

This means that EDESR.RC is set to the value of EDECR.RCE on a Warm reset. EDESR.RC is cleared to 0 on exiting Debug state.

### H3.7.1 Pseudocode description of Reset Catch debug event

The `CheckResetCatch()` function is called after reset before executing any instruction.

```
// CheckResetCatch()
// =================
// Called after reset

CheckResetCatch()
    if EDECR.RCE == '1' then
        EDESR.RC = '1';
        // If halting is allowed then halt immediately
        if HaltingAllowed() then Halt(DebugHalt_ResetCatch);
```

The `CheckPendingResetCatch()` function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.

```
// CheckPendingResetCatch()
// ========================
// Check whether EDESR.RC has been set by a Reset Catch debug event

CheckPendingResetCatch()
    if HaltingAllowed() && EDESR.RC == '1' then
        Halt(DebugHalt_ResetCatch);
```

## H3.8 Software Access debug event

When the value of EDSCR.TDA == 1, software access to the following debug AArch64 System registers and AArch32 CP14 registers cause a trap to Debug state:

- The Breakpoint Value Registers, DBGBVR.
- The Breakpoint Control Registers, DBGBCR.
- The Watchpoint Value Registers, DBGWVR.
- The Watchpoint Control Registers, DBGWCR.

However, EDSCR.TDA is ignored if one of:

- The value of OSLSR.OSLK == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See *Halting allowed and halting prohibited* on page H2-4821.
- The register access generates an exception.

**Note**

- DBGPRCR.CORENPDRQ (Core No-powerdown Request), DCC registers, and CLAIM tag bits are also shared, but are deliberately excluded from this list.
- Only accesses as System registers in AArch64 state or CP14 registers in AArch32 state generate a trap. Accesses to the memory-mapped interface by a PE are not trapped.

### H3.8.1 Pseudocode description of Software Access debug event

The pseudocode for `CheckSoftwareAccessToDebugRegisters()` is as follows:

```
// CheckSoftwareAccessToDebugRegisters()
// =====================================
// Check for access to Breakpoint and Watchpoint registers.

CheckSoftwareAccessToDebugRegisters()

    os_lock = (if ELUsingAArch32(EL1) then DBGOSLSR.OSLK else OSLSR_EL1.OSLK);
    if HaltingAllowed() && EDSCR.TDA == '1' && os_lock == '0' then
        Halt(DebugHalt_SoftwareAccess);
```

## H3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
  - External debug registers.
  - System registers, including system debug registers.
  - Special-purpose registers.
- The state of the external authentication interface.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a *Context synchronization operation* before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Software debug events. See *Synchronization and debug exceptions* on page D2-1701 for exceptions taken from AArch64 state, or *Synchronization and debug exceptions* on page G2-3945 for exceptions taken from AArch32 state.
- The generation of all Halting debug events.
- Taking a pending Halting debug event or other asynchronous Debug event. See:
  - *Pending Halting debug events*.
  - *Taking Halting debug events asynchronously* on page H3-4883.
- The behavior of the Halting Step state machine. See *Synchronization and the Halting Step state machine* on page H3-4870.

If there is an instruction between the change and the *Context synchronization operation*, it is CONSTRAINED UNPREDICTABLE whether the PE uses the old state or the new state.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit *Context synchronization operation*. For more information on the synchronization of register updates see:

- *Synchronization requirements for System registers* on page D7-1908.
- *Synchronization of changes to the external debug registers* on page H8-4946.
- *State and mode changes without explicit context synchronization operations* on page G2-3946.

A change on the external authentication interface is typically asynchronous to software and can happen without a *Context synchronization operation*.

External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface.

Example H3-3 shows an example of the synchronization requirements.

**Example H3-3 Synchronization requirements**

---

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if **DBGEN** or **SPIDEN** or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

---

### H3.9.1 Pending Halting debug events

A pending Halting debug event is taken when halting becomes allowed. This can happen without a *Context synchronization operation* if:

- The PE enters Non-secure state with `ExternalInvasiveDebugEnabled()` == TRUE, and this is not the result of an exception return. See *State and mode changes without explicit context synchronization operations* on page G2-3946.
- A change on the external authentication interface means halting becomes allowed in the current state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- The OS Double Lock status, `DoubleLockStatus()` becomes FALSE. For example, this can happen when software clears OSDLR.DLK to 0 or sets DBGPRCR.COREPDRQ to 1.
- The debug event is an OS Unlock Catch debug event. OS Unlock Catch debug events are generated in a pending state, rather than taken synchronously.

In these cases a pending Halting debug event is taken asynchronously.

### H3.9.2 Taking Halting debug events asynchronously

The ARM architecture does not define when Halting debug events that are taken asynchronously are taken.

Any Halting debug event that is observed as pending in the EDESR before a *Context synchronization operation*, or an External Debug Request debug event that is asserted before a *Context synchronization operation*, is taken and the PE enters Debug state before the first instruction following the *Context synchronization operation* completes its execution. This is only possible if halting is allowed after completion of the *Context synchronization operation*.

If the first instruction after the *Context synchronization operation* generates a synchronous exception, or an asynchronous exception is also pending, then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

- A Halting Step debug event is pending. EDESR.SS == 1.
- The *Context synchronization operation* is an exception return from a state where halting is prohibited to a state where halting is allowed.

**Note**

This applies to an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled()` == FALSE to Non-secure state with `ExternalInvasiveDebugEnabled()` == TRUE.

In this case the order in which the debug events are handled is specified to avoid a double-step. See *Entering the active-pending state* on page H3-4869.

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state

**Note**

These rules are based on the rules that apply to taking asynchronous exceptions. See *Asynchronous exception types, routing, masking and priorities* on page D1-1569.

# Chapter H4
# The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the *Debug Communications Channel* (DCC) and the *Instruction Transfer Register* (ITR), and associated control flags. It contains the following sections:

- *Introduction* on page H4-4886.
- *DCC and ITR registers* on page H4-4887.
- *DCC and ITR access modes* on page H4-4889.
- *Flow control of the DCC and ITR registers* on page H4-4893.
- *Synchronization of DCC and ITR accesses* on page H4-4897.
- *Interrupt-driven use of the DCC* on page H4-4902.
- *Pseudocode description of the operation of the DCC and ITR registers* on page H4-4903.

**Note**

Where necessary Table K13-1 on page K13-5708 disambiguates the general register references used in this chapter.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H4.1 Introduction

The *Debug Communications Channe*l, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the *debug host*.
- The debug implementation on the PE, described as the *debug target*.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H4.2 DCC and ITR registers

The DCC comprises *data transfer registers*, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, EDITR, and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:

- A receive and transmit pair for 32-bit full duplex operation:
  - The write-only DBGDTRTX_EL0 register to transmit data.
  - The read-only DBGDTRRX_EL0 register to receive data.
- A single 64-bit read/write register, DBGDTR_EL0, for 64-bit half-duplex operation.
- The read/write OSDTRTX_EL1 and OSDTRRX_EL1 registers for save and restore.

In AArch32 state, software can only access the data transfer registers as:

- A receive and transmit pair, for 32-bit full duplex operation:
  - The write-only DBGDTRTXint register to transmit data.
  - The read-only DBGDTRRXint register to receive data.
- The read/write DBGDTRTXext and DBGDTRRXext registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, DBGDTRRX_EL0 and DBGDTRTX_EL0. Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are EDSCR.{RXfull, TXfull, RXO, TXU}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the debug System registers in DCCSR.
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in DSCR.
- The flow-control flags are accessible from the external debug interface in EDSCR.

Figure H4-1 on page H4-4888 shows the System register and external debug interface views of the EDSCR and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

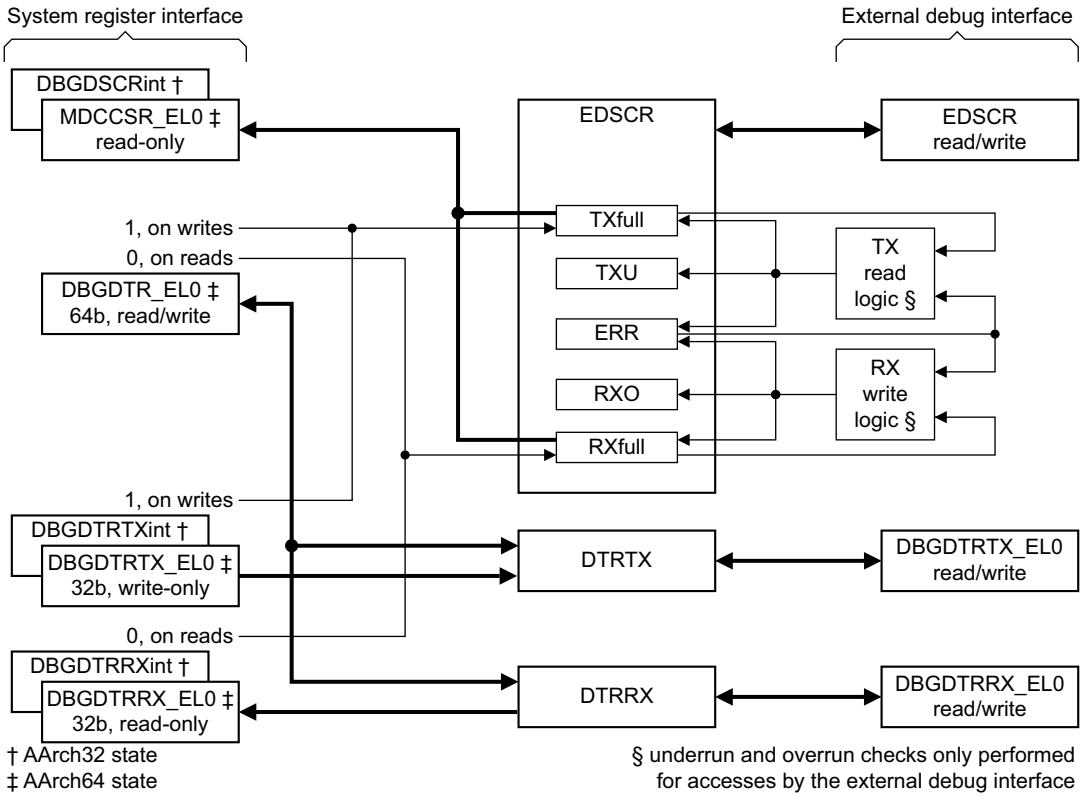

**Figure H4-1 System register and external debug interface views of EDSCR and DTR registers, Normal access mode**

EDITR and the ITR flow-control flags, EDSCR.{ITE, ITO} are accessible only by the external debug interface:

- The EDITR specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

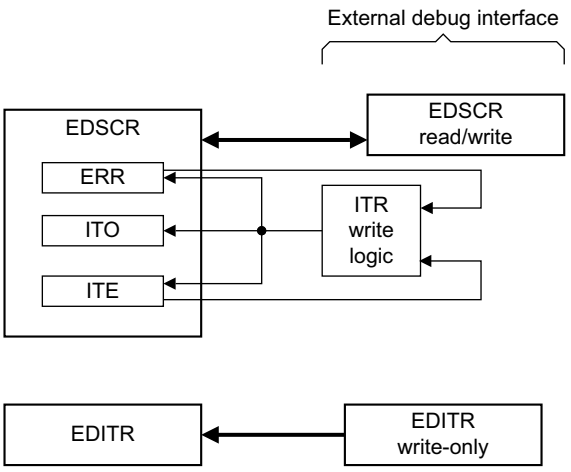

**Figure H4-2 External debug interface views of EDSCR and EDITR registers, Normal access mode**

The sticky overflow flag, EDSCR.ERR, is used by both the DCC and ITR to report flow-control errors.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

- *Normal access mode*, when EDSCR.MA == 0 or the PE is in Non-debug state.
- *Memory access mode* on page H4-4890, when EDSCR.MA == 1 and the PE is in Debug state.

### H4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

**For accesses by software:**

- Direct writes to DBGDTRTX update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from DBGDTRRX return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to DBGDTR_EL0 update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
  - DTRTX is set from bits[31:0] of the transfer register.
  - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from DBGDTR_EL0 return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
  - Bits[31:0] of the transfer register are set from DTRRX.
  - Bits[63:32] of the transfer register are set from DTRTX.

**Note**

For DBGDTR_EL0, the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using DCCSR.

**For accesses by the external debug interface:**

- Writes to EDITR trigger the instruction to be executed if the PE is in Debug state:
  - If the PE is in AArch64 state, this is an A64 instruction.
  - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of DBGDTRTX_EL0 return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to DBGDTRTX_EL0 update the value in DTRTX and do not change TXfull.
- Reads of DBGDTRRX_EL0 return the value in DTRRX and do not change RXfull.
- Writes to DBGDTRRX_EL0 update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in EDSCR.

The PE detects overrun and underrun by the external debug interface, and records errors in EDSCR.{TXU, RXO, ITO, ERR}. See *Flow control of the DCC and ITR registers* on page H4-4893.

See also *Synchronization of DCC and ITR accesses* on page H4-4897.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H4.3.2 Memory access mode

When the PE is in Debug state, *Memory access mode* can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can only be enabled in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- External reads from DBGDTRTX_EL0 cause:
  1. The existing value in DTRTX to be returned. This clears EDSCR.TXfull to 0.
  2. The equivalent of `LDR W1,[X0],#4`, if in AArch64 state, or `LDR R1,[R0],#4`, if in AArch32 state, to be executed.
  3. The equivalent of the `MSR DBGDTRTX_EL0,X1` instruction, if in AArch64 state, or the `MCR p14,0,R1,c0,c5,0` instruction, if in AArch32 state, to be executed.
  4. EDSCR.{TXfull, ITE} to be set to {1,1}, and X1 or R1 to be set to an UNKNOWN value.
- External writes to DBGDTRRX_EL0 cause:
  1. The value in DTRRX to be updated. This sets EDSCR.RXfull to 1.
  2. The equivalent of the instruction `MRS X1,DBGDTRRX_EL0`, if in AArch64 state, or `MRC p14,0,R1,c0,c5,0` if in AArch32 state, to be executed.
  3. The equivalent of the instruction `STR W1,[X0],#4`, if in AArch64 state, or `STR R1,[R0],#4`, if in AArch32 state, to be executed.
  4. EDSCR.{RXfull, ITE} to be set to {0,1}, and X1 or R1 to be set to an UNKNOWN value.
- External reads from DBGDTRRX_EL0 return the last value written to DTRRX.
- External writes to EDITR generate an overrun error.

During these accesses, EDSCR.{TXfull, RXfull, ITE} are used for flow control.

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to DBGDTRRX_EL0, in AArch64 state, RXfull might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
- Data Aborts occur in order.
- The constraints of the memory type are met.
- In the list describing *External reads from DBGDTRTX_EL0*:
  - The `MSR` equivalent operation at step 3 of the sequence reads the value loaded by step 2.
  - If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the `MSR` equivalent operation at the previous iteration of step 3.
- In the list describing *External writes to DBGDTRRX_EL0*:
  - The `MRS` equivalent operation at step 2 of the sequence returns the value written at step 1.
  - The `STR` equivalent at step 3 of the sequence writes the value read at step 2.
- If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

See *Flow control of the DCC and ITR registers* on page H4-4893 for more information on overrun and underrun.

### Ordering, access sizes and effect on exclusive monitors

For the purposes of memory ordering, access sizes, and effect on the exclusive monitor, accesses in Memory access mode are consistent with Load/Store word instructions executed by the PE.

### Data aborts

If the memory access generates a Data Abort, then:

- The Data Abort exception is taken. See *Exceptions in Debug state* on page H2-4851. In particular, EDSCR.ERR is set to 1. See *Cumulative error flag* on page H4-4895.
- Register R0 retains the address that generated the abort.
- Register R1 is set to an UNKNOWN value.
- EDSCR.TXfull, for a load, or EDSCR.RXfull, for a store, is set to an UNKNOWN value.
- DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
- EDSCR.ITE is set to 1.

### Illegal Execution state exception

If PSTATE.IL is set to 1 when EDSCR.MA == 1, then on an external write access to DBGDTRRX_EL0 or an external read from DBGDTRTX_EL0, it is CONSTRAINED UNPREDICTABLE whether the PE:

- Takes an Illegal Execution state exception without performing any operations. In this case:
  - EDSCR.ERR is set to 1, see *Cumulative error flag* on page H4-4895.
  - Register R0 is unchanged.
  - Register R1 is set to an UNKNOWN value.
  - EDSCR.TXfull or EDSCR.RXfull, as applicable, is set to an UNKNOWN value.
  - DTRTX or DTRRX, as applicable, is set an UNKNOWN value.
  - EDSCR.ITE is set to 1.

  See also *Exceptions in Debug state* on page H2-4851.
- Ignores PSTATE.IL.

**Note**

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting EDSCR.MA to 1. These instructions generate an Illegal state exception if PSTATE.IL is set to 1.

### Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
  1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
  2. The PE makes a memory access to `Align(X[0],4)` in AArch64 state, or `Align(R[0],4)` in AArch32 state.
  3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
  4. The PE does nothing.
- Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.
- For external writes to DBGDTRRX_EL0, if the PE writes to memory, an UNKNOWN value is written.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For external reads of DBGDTRTX_EL0 an UNKNOWN value is returned.
- The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a DBGDTRTX_EL0 read can trigger a TX underrun, and a DBGDTRTX_EL0 write can trigger an RX overrun.

### H4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in EDSCR by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see *Register access permissions for memory-mapped accesses* on page H8-4950.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H4.4 Flow control of the DCC and ITR registers

This sub-section describes the flow-control of the DCC and ITR registers:

- *Ready flags*.
- *Buffering writes to EDITR*.
- *Overrun and underrun flags* on page H4-4894.
- *Cumulative error flag* on page H4-4895.

### H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
  - EDSCR.RXfull == 1 indicates that DBGDTRRX_EL0 contains a valid value that has been written by the external debugger and not yet read by software running on the target.
  - EDSCR.TXfull == 1 indicates that DBGDTRTX_EL0 contains a valid value that has been written by software running on the target and not yet read by an external debugger.
- For the ITR register there is a single ready flag:
  - EDSCR.ITE == 1 indicates that the PE is ready to accept an instruction to the ITR.

    **Note**

    The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if EDSCR.ERR is set, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- EDSCR.{RXfull, ITE} == {0,1} indicates that DBGDTRRX_EL0 is empty and the PE is ready to accept a word external write to DBGDTRRX_EL0.
- EDSCR.{TXfull, ITE} == {1,1} indicates that DBGDTRTX_EL0 is full and the PE is ready to accept a word external read from DBGDTRTX_EL0.

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in *Overrun and underrun flags* on page H4-4894.

EDSCR.{ITE, RXfull, TXfull} shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, EDSCR.ERR is set or the software lock is locked for memory-mapped accesses (EDLSR.SLK == 1).

### H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if EDSCR.ERR is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.
- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as `DCPS` or `DRPS`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to EDRCR.CSE.

**Note**

The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

Table H4-1 shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

**Table H4-1 DCC and ITR ready flags and the associated overrun/underrun flags**

| External debug interface access | Overrun/Underrun condition | EDSCR flag |
|---|---|---|
| Write DBGDTRRX_EL0 | `EDSCR.RXfull == '1' \|\| (Halted() && EDSCR.MA == '1' && EDSCR.ITE == '0')` | RXO |
| Read DBGDTRTX_EL0 | `EDSCR.TXfull == '0' \|\| (Halted() && EDSCR.MA == '1' && EDSCR.ITE == '0')` | TXU |
| Write EDITR | `Halted() && (EDSCR.ITE == '0' \|\| EDSCR.MA == '1')` | ITO |

When an overrun or underrun flag is set to 1, the cumulative error flag, EDSCR.ERR, described in *Cumulative error flag* on page H4-4895, is also set to 1.

In the event of an external write to DBGDTRRX_EL0 or EDITR generating an overrun, or an external read from DBGDTRTX_EL0 generating an underrun:

- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- EDSCR.TXfull, EDSCR.RXfull or EDSCR.ITE, as applicable, are not updated.

There is no overrun or underrun detection on external reads of DBGDTRRX_EL0 or external writes of DBGDTRTX_EL0.

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:

- If RXfull == 0, a direct read of DBGDTRRX or DBGDTR_EL0 returns UNKNOWN.
- If TXfull == 1, a direct write of:
  - DBGDTRTX sets DTRTX to UNKNOWN.
  - DBGDTR_EL0 sets DTRRX and DTRTX to UNKNOWN.

See *DCC accesses in Non-debug state* on page H4-4898 for more information.

#### Accessing 64-bit data

In AArch64 state, a software access to the DBGDTR_EL0 register and an external debugger access to both DBGDTRRX_EL0 and DBGDTRTX_EL0 can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:

- If software directly writes a 64-bit value to DBGDTR_EL0, only TXfull is set to 1, meaning:
  - A subsequent external write to DBGDTRRX_EL0 would not be detected as an overrun.
  - If the external debugger reads DBGDTRTX_EL0 first, software might observe MDCCSR_EL0.TXfull == 0 and send a second value before the external debugger reads DBGDTRRX_EL0, leading to an undetected overrun.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- On external writes to both DBGDTRRX_EL0 and DBGDTRTX_EL0 only RXfull is set to 1, meaning:
  - A subsequent direct write of DBGDTRTX_EL0 would not be detected as an overrun.
  - If the external debugger writes to DBGDTRRX_EL0 first, software might observe MDCCSR_EL0.RXfull == 1 and read a full 64-bit value, before the external debugger writes to DBGDTRTX_EL0, leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:

- The external debugger must check EDSCR.{RXfull, TXfull} before each transfer.
- To receive a 64-bit value from the target, the external debugger must read DBGDTRRX_EL0 before reading DBGDTRTX_EL0.
- To send a 64-bit value to the target, the external debugger must write to DBGDTRTX_EL0 before writing DBGDTRRX_EL0.

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

### H4.4.4 Cumulative error flag

The cumulative error flag, EDSCR.ERR, is set to 1:

- On taking an exception from Debug state.
- On any signaled overrun or underrun in the DCC or ITR.

When EDSCR.ERR == 1:

- External reads of DBGDTRTX_EL0 do not have any side-effects.
- External writes to DBGDTRRX_EL0 are ignored.
- External writes to EDITR are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to EDITR that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check EDSCR.{RXfull, TXfull, ITE} before each access.
- Check EDSCR.{ITO, RXO, TXU} following each access, for overrun or underrun.
- Check PSTATE or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared by writing 1 to EDRCR.CSE. See *EDRCR, External Debug Reserve Control Register* on page H9-5041.

For overruns and underruns, EDSCR.{ITO, RXO, TXU} record the error type.

#### Pseudocode description of clearing the error flag

The pseudocode for the `ClearStickyError()` function is as follows:

```
// ClearStickyErrors()
// ===================

ClearStickyErrors()
    EDSCR.TXU = '0';            // Clear TX underrun flag
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
EDSCR.RXO = '0';            // Clear RX overrun flag
if Halted() then            // in Debug state
    EDSCR.ITO = '0';        // Clear ITR overrun flag
EDSCR.ERR = '0';            // Clear cumulative error flag
return;
```

## H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- *Summary of System register accesses to the DCC*.
- *DCC accesses in Non-debug state* on page H4-4898.

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

**Note**

In *Synchronization requirements for System registers* on page D7-1908 external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to DBGDTRRX_EL0 and DBGDTRTX_EL0 are asynchronous to direct reads of, and direct writes to, DBGDTRRX, DBGDTRTX, and in AArch64 state DBGDTR_EL0, made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

**DCC flags** Means any or all of the following:
- The EDSCR.{RXfull.TXfull} ready flags.
- The EDSCR.RXO overrun flag.
- The EDSCR.TXU underrun flag.
- The EDSCR.ERR cumulative error flag.

**ITR flags** Means any or all of the following:
- The EDSCR.ITE ready flag.
- The EDSCR.ITO overrun flag.
- The EDSCR.ERR cumulative error flag.

### H4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in Table H4-2 on page H4-4898. Several of these instructions access the same registers using different encodings.

With the exception of the read and write bits, DBGDTRRX and DBGDTRTX are the same encoding, with exception of the read/write bits, but use different registers. The ARMv8 architecture governs the order of these instructions, as described in *Synchronization requirements for System registers* on page D7-1908. For more details, see the description of the individual register in the relevant chapter, Chapter D7 *AArch64 System Register Descriptions* or Chapter G6 *AArch32 System Register Descriptions*.

Table H4-2 on page H4-4898 shows a summary of System register accesses to the DCC.

**Table H4-2 Summary of System register accesses to the DCC**

| Operation | OS Lock | AArch64 (MRS/MSR) | AArch32 (MRC/MCR) | Description |
|---|---|---|---|---|
| Read | - | DBGDTRRX_EL0 | DBGDTRRXint | Direct read of DTRRX<br>Indirect write to the DCC flags |
| Write | - | DBGDTRTX_EL0 | DBGDTRTXint | Direct read of DTRTX<br>Indirect write to the DCC flags |
| Read/write | - | DBGDTR_EL0 | - | Direct read/write of both DTRRX and DTRTX<br>Indirect write to the DCC flags |
| Read | - | MDCCSR_EL0 | DBGDSCRint | Direct read of the DCC flags |
| Read/write | - | OSDTRRX_EL1 | DBGDTRRXext | Direct read/write of DTRRX |
| Read/write | - | OSDTRTX_EL1 | DBGDTRTXext | Direct read/write of DTRTX |
| Read | Unlocked | MDSCR_EL1 | DBGDSCRext | Direct read of DCC flags |
| Read/write | Locked | MDSCR_EL1 | DBGDSCRext | Direct read/write of DCC flags |

### H4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in *Normal access mode* on page H4-4889:

- If a direct read of DCCSR returns RXfull == 1, then a following direct read of DBGDTRRX, or in AArch64 state of DBGDTR_EL0, returns valid data and indirectly writes 0 to DCCSR.RXfull as a side-effect.
- If a direct read of DCCSR returns TXfull == 0, then a following direct write to DBGDTRTX, or in AArch64 state to DBGDTR_EL0, writes the intended value, and indirectly writes 1 to DCCSR.TXfull as a side-effect.

No context synchronization operation is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the DCC flags as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of DBGDTRRX is an indirect write to DCCSR.RXfull, it must occur in program order with respect to the direct read of DCCSR, meaning it must not return a speculative value for DTTRX that predates the RXfull flag returned by the read of DCCSR. The direct write to DBGDTRTX must not be executed speculatively.

Direct reads of DBGDTRRX, or in AArch64 state DBGDTR_EL0, and DCCSR, must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the DCC flags occurs immediately after the direct DTR access.

  **Note**

  For an access to DBGDTR_EL0, this means the indirect write happens after both DBGDTRRX_EL0 and DBGDTRTX_EL0 have been accessed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- In the simple sequential execution model, for an external read of DBGDTRTX_EL0 or an external write of DBGDTRRX_EL0:
  - The check of the DCC flags for overrun or underrun occurs immediately before the access.
  - If there is no underrun or overrun, the update of the DCC flags occurs immediately after the access.
  - If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

**Note**

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

- The value written by the external write to DBGDTRRX_EL0 that does not overrun, must be observable to direct reads of DBGDTRRX and DBGDTR_EL0 in finite time.
- The DCC flags that are updated as a side-effect of the external write or external read must be observable:
  - To subsequent external reads of EDSCR.
  - To subsequent external reads of DBGDTRRX_EL0 when checking for underrun.
  - To subsequent external writes to DBGDTRTX_EL0 when checking for overrun.
  - To direct reads of DCCSR in finite time.

However, explicit synchronization is required to guarantee that a direct read of DCCSR returns up-to-date DCC flags. This means that if a signal is received from another agent that indicates that DCCSR must be read, an `ISB` is required to ensure that the direct read of DCCSR occurs after the signal has been received. This also synchronizes the value in DBGDTRRX, if applicable. However, if that signal is an interrupt exception triggered by **COMMIRQ**, **COMMTX**, or **COMMRX**, the exception entry is sufficient synchronization. See *Synchronization of DCC interrupt request signals* on page H4-4901.

Explicit synchronization is required following a direct read or direct write:

- To ensure that a value directly written to DBGDTRTX is observable to external reads of DBGDTRTX_EL0.
- To ensure that a value directly written to DBGDTR_EL0 is observable to external reads of DBGDTRTX_EL0 and DBGDTRRX_EL0.
- To guarantee that the indirect writes to the DCC flags that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
  - Observable to external reads of EDSCR.
  - Observable to external reads of DBGDTRRX_EL0 when checking for underrun.
  - Observable to external writes of DBGDTRTX_EL0 when checking for overrun.
  - Returned by a following direct read of DCCSR.

See also *Memory-mapped accesses to the DCC and ITR* on page H4-4892 and *Synchronization of changes to the external debug registers* on page H8-4946.

**Note**

These ordering rules mean that software:

- Must not read DBGDTRRX without first checking DCCSR.RXfull or if the previously-read value of DCCSR.RXfull is 0.

  It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.
- Must not write DBGDTRTX without first checking DCCSR.TXfull or if the previously-read value of DCCSR.TXfull is 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The write to DBGDTRTX overwrites the value in DTRTX, and the external debugger might or might not have read this value.

- Must ensure there is an explicit context synchronization operation following a DTR access, even if not immediately returning to read DCCSR again. This synchronization operation can be an exception return.

---

### Derived requirements

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of DBGDTRRX when RXfull is 1:
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write.
  - If an external read of EDSCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by a following external write to DBGDTRRX, and the following external write does not overrun.
- Following a direct read of DBGDTR_EL0, when RXfull is 1:
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write nor by a following direct write to DBGDTRTX.
  - If an external read of EDSCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to DBGDTRRX and DBGDTRTX in any order, and the following external write of DBGDTRRX will not overrun.
- Following a direct write to DBGDTRTX, when TXfull is 0:
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the value returned by the external read must be the value written by the previous direct write.
  - If an external read of EDSCR returns a TXfull value of 1, then the value returned by a following external read of DBGDTRRX must be the value written by the previous direct read, and the subsequent external read will not underrun.
- Following a direct write to DBGDTR_EL0, when TXfull is 0:
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the values returned by the external read and by a subsequent external read of DBGDTRRX must be the value written by the previous direct write.
  - If an external read of EDSCR returns a TXfull value of 1, then the value returned by subsequent external reads of DBGDTRRX and DBGDTRTX, in any order, must be the value written by the previous direct read, and the subsequent external read of DBGDTRTX does not underrun.
- Following an external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0, then the value returned by the external read must not be affected by a following direct write to DBGDTRTX.
- Following a first external read DBGDTRRX and a following second external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0, then the values returned by the external reads must not be affected by a following direct write to DBGDTR_EL0.
- Following an external write to DBGDTRRX that does not overrun, if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a following direct read of DBGDTRRX or DBGDTR_EL0 must be the value written by the previous external write.
- Following a first external write to DBGDTRTX and a following second external write to DBGDTRRX that does not overrun, if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a subsequent direct read of DBGDTR_EL0 must return the values written by the previous external writes.

### H4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, **COMMIRQ**, **COMMTX**, and **COMMRX**, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of DCCSR or DBGDTRRX, or a direct write of DBGDTRTX executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of DBGDTRTX executed after taking an interrupt exception generated by the interrupt request.

Following a direct read of DBGDTRRX or a direct write to DBGDTRRX, software must execute a context synchronization operation to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

### H4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to EDITR must be observable to an external write or an external read in finite time:
  - A direct read of DBGDTRRX must be observable to an external write of DBGDTRRX_EL0.
  - A direct read of DBGDTR_EL0 must be observable to an external write of DBGDTRRX_EL0 and DBGDTRTX_EL0.
  - A direct write of DBGDTRTX must be observable to an external read of DBGDTRTX_EL0.
  - A direct write of DBGDTR_EL0 must be observable to an external read of DBGDTRRX_EL0 and DBGDTRTX_EL0.

  This includes the indirect write to the DCC flags that occurs atomically with the access as described in *DCC accesses in Non-debug state* on page H4-4898.

  The subsequent external write or external read must observe either the old or the new values of both the DTR contents and DCC flags. If the old values are observed, this typically results in overrun or underrun, assuming the old values of the DCC flags indicate an overrun or underrun condition, as would normally be the case.

  This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the DCC flags in EDSCR, because it can rely on overrun and underrun tests.

- External reads of DBGDTRTX_EL0 that do not underrun and external writes to DBGDTRRX_EL0 that do not overrun must be observable to an instruction subsequently written to EDITR on completion of the first external access. This includes the indirect write to the DCC flags.

  This means that without explicit synchronization and without the need to first check the DCC flags in DCCSR:
  - If the instruction is a direct read of DBGDTRRX, it observes the external write.
  - If the instruction is a direct write of DBGDTRTX, it observes the external read.
- Writes to EDITR that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.

- After an external write to the EDITR, the ITR flags that are updated as a side effect of that write must be observable by:
  - An external read of the EDSCR that follows the external write to the EDITR.
  - When checking for overrun, another external write to the EDITR that follows the original external write to the EDITR.

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in *Memory access mode* on page H4-4890.

## H4.6 Interrupt-driven use of the DCC

ARM recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

**Note**

- In addition to connection to the interrupt controller ARM also recommends **COMMIRQ**, **COMMTX**, and **COMMRX** signals that might be implemented for use by any legacy system peripherals.
- GICv3 reserves a private peripheral interrupt number for the **COMMIRQ** interrupt.

The DCCINT register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, **COMMIRQ**, is needed at the interrupt controller.

See also *Synchronization of DCC interrupt request signals* on page H4-4901.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when OSLSR.OSLK == 1, meaning that the OS lock is locked.

The definition of the DTR Registers is:

```
bits(32) DTRRX;
bits(32) DTRTX;
```

The pseudocode for the DBGDTR_EL0() function is as follows:

```
// DBGDTR_EL0[] (write)
// ===================
// System register writes to DBGDTR_EL0, DBGDTRTX_EL0 (AArch64) and DBGDTRTXint (AArch32)

DBGDTR_EL0[] = bits(N) value
    // For MSR DBGDTRTX_EL0,<Rt>  N=32, value=X[t]<31:0>, X[t]<63:32> is ignored
    // For MSR DBGDTR_EL0,<Xt>    N=64, value=X[t]<63:0>
    assert N IN {32,64};
    if EDSCR.TXfull == '1' then
        value = bits(N) UNKNOWN;
    // On a 64-bit write, implement a half-duplex channel
    if N == 64 then DTRRX = value<63:32>;
    DTRTX = value<31:0>;        // 32-bit or 64-bit write
    EDSCR.TXfull = '1';
    return;

// DBGDTR_EL0[] (read)
// ===================
// System register reads of DBGDTR_EL0, DBGDTRRX_EL0 (AArch64) and DBGDTRRXint (AArch32)

bits(N) DBGDTR_EL0[]
    // For MRS <Rt>,DBGDTRTX_EL0  N=32, X[t]=Zeros(32):result
    // For MRS <Xt>,DBGDTR_EL0    N=64, X[t]=result
    assert N IN {32,64};
    bits(N) result;
    if EDSCR.RXfull == '0' then
        result = bits(N) UNKNOWN;
    else
        // On a 64-bit read, implement a half-duplex channel
        // NOTE: the word order is reversed on reads with regards to writes
        if N == 64 then result<63:32> = DTRTX;
        result<31:0> = DTRRX;
    EDSCR.RXfull = '0';
    return result;
```

The pseudocode for the DBGDTRRX_EL0() function is as follows:

```
// DBGDTRRX_EL0[] (external write)
// ===============================
// Called on writes to debug register 0x08C.

DBGDTRRX_EL0[boolean memory_mapped] = bits(32) value

    if EDPRSR<6:5,0> != '001' then                      // Check DLK, OSLK and PU bits
        IMPLEMENTATION_DEFINED "signal slave-generated error";
        return;

    if EDSCR.ERR == '1' then return;                    // Error flag set: ignore write

    // The Software lock is OPTIONAL.
    if memory_mapped && EDLSR.SLK == '1' then return;   // Software lock locked: ignore write

    if EDSCR.RXfull == '1' || (Halted() && EDSCR.MA == '1' && EDSCR.ITE == '0') then
        EDSCR.RXO = '1';  EDSCR.ERR = '1';              // Overrun condition: ignore write
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        return;

    EDSCR.RXfull = '1';
    DTRRX = value;

    if Halted() && EDSCR.MA == '1' then
        EDSCR.ITE = '0';                                // See comments in EDITR[] (external write)

        if !UsingAArch32() then
            ExecuteA64(0xD5330501<31:0>);               // A64 "MRS X1,DBGDTRRX_EL0"
            ExecuteA64(0xB8004401<31:0>);               // A64 "STR W1,[X0],#4"
            X[1] = bits(64) UNKNOWN;
        else
            ExecuteT32(0xEE10<15:0> /*hw1*/, 0x1E15<15:0> /*hw2*/);  // T32 "MRS R1,DBGDTRRXint"
            ExecuteT32(0xF840<15:0> /*hw1*/, 0x1B04<15:0> /*hw2*/);  // T32 "STR R1,[R0],#4"
            R[1] = bits(32) UNKNOWN;

        // If the store aborts, the Data Abort exception is taken and EDSCR.ERR is set to 1
        if EDSCR.ERR == '1' then
            EDSCR.RXfull = bit UNKNOWN;
            DBGDTRRX_EL0 = bits(32) UNKNOWN;
        else
            // "MRS X1,DBGDTRRX_EL0" calls DBGDTR_EL0[] (read) which clears RXfull.
            assert EDSCR.RXfull == '0';

        EDSCR.ITE = '1';                                // See comments in EDITR[] (external write)
    return;

// DBGDTRRX_EL0[] (external read)
// ==============================

bits(32) DBGDTRRX_EL0[boolean memory_mapped]
    return DTRRX;
```

The pseudocode for the DBGDTRTX_EL0() function is as follows:

```
// DBGDTRTX_EL0[] (external read)
// ==============================
// Called on reads of debug register 0x080.

bits(32) DBGDTRTX_EL0[boolean memory_mapped]

    if EDPRSR<6:5,0> != '001' then                      // Check DLK, OSLK and PU bits
        IMPLEMENTATION_DEFINED "signal slave-generated error";
        return bits(32) UNKNOWN;

    underrun = EDSCR.TXfull == '0' || (Halted() && EDSCR.MA == '1' && EDSCR.ITE == '0');
    value = if underrun then bits(32) UNKNOWN else DTRTX;

    if EDSCR.ERR == '1' then return value;              // Error flag set: no side-effects

    // The Software lock is OPTIONAL.
    if memory_mapped && EDLSR.SLK == '1' then           // Software lock locked: no side-effects
        return value;

    if underrun then
        EDSCR.TXU = '1';  EDSCR.ERR = '1';              // Underrun condition: block side-effects
        return value;                                   // Return UNKNOWN

    EDSCR.TXfull = '0';

    if Halted() && EDSCR.MA == '1' then
        EDSCR.ITE = '0';                                // See comments in EDITR[] (external write)

        if !UsingAArch32() then
            ExecuteA64(0xB8404401<31:0>);               // A64 "LDR W1,[X0],#4"
        else
            ExecuteT32(0xF850<15:0> /*hw1*/, 0x1B04<15:0> /*hw2*/);      // T32 "LDR R1,[R0],#4"

# Chapter H5
# The Embedded Cross-Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- *About the Embedded Cross-Trigger (ECT)* on page H5-4908.
- *Basic operation on the ECT* on page H5-4910.
- *Cross-triggers on a PE in an ARMv8 implementation* on page H5-4914.
- *Description and allocation of CTI triggers* on page H5-4915.
- *CTI registers programmers' model* on page H5-4919.
- *Examples* on page H5-4920.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H5.1 About the Embedded Cross-Trigger (ECT)

The *Embedded Cross-Trigger*, ECT, allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs when a trigger event occurs on another PE. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 shows the logical structure of an ECT.

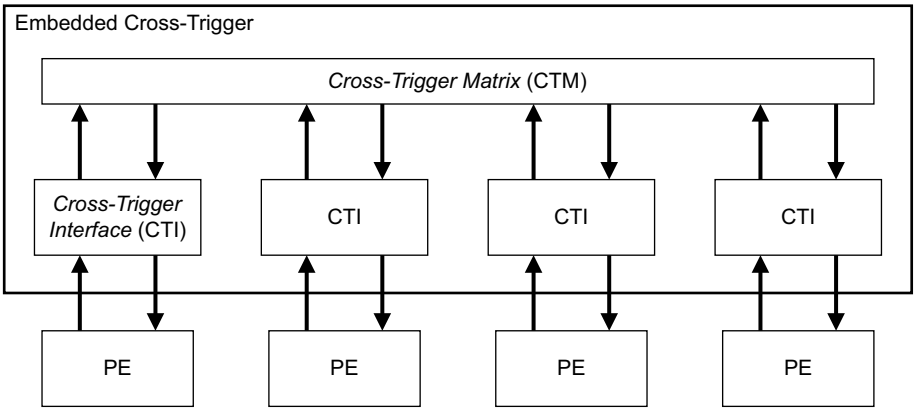

**Figure H5-1 Structure of an embedded cross-trigger**

The ECT can deliver many types of trigger events, which are described in the following sections:

- *Debug request trigger event* on page H5-4916.
- *Restart request trigger event* on page H5-4916.
- *Cross-halt trigger event* on page H5-4916.
- *Performance Monitors overflow trigger event* on page H5-4917.
- *Generic trace external input trigger events* on page H5-4917.
- *Generic trace external output trigger events* on page H5-4917.
- *Generic CTI interrupt trigger event* on page H5-4917.

An ARMv8-A implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

See *Cross-triggers on a PE in an ARMv8 implementation* on page H5-4914.

In addition, ARM recommends that the cross-trigger includes:

- The ability to route trigger events between Trace extensions:
  - These typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

**Note**

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.

## H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the cross-trigger interface, CTI, are:

- The input triggers:
  - These are trigger event inputs from the PE to the CTI.
- The output triggers:
  - These are trigger event outputs from the CTI to the PE.
- The input channels:
  - These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.
- The output channels:
  - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
  - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
  - The output triggers are numbered 0-31.

Figure H5-2 on page H5-4911 shows the logical internal structure of a CTI.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

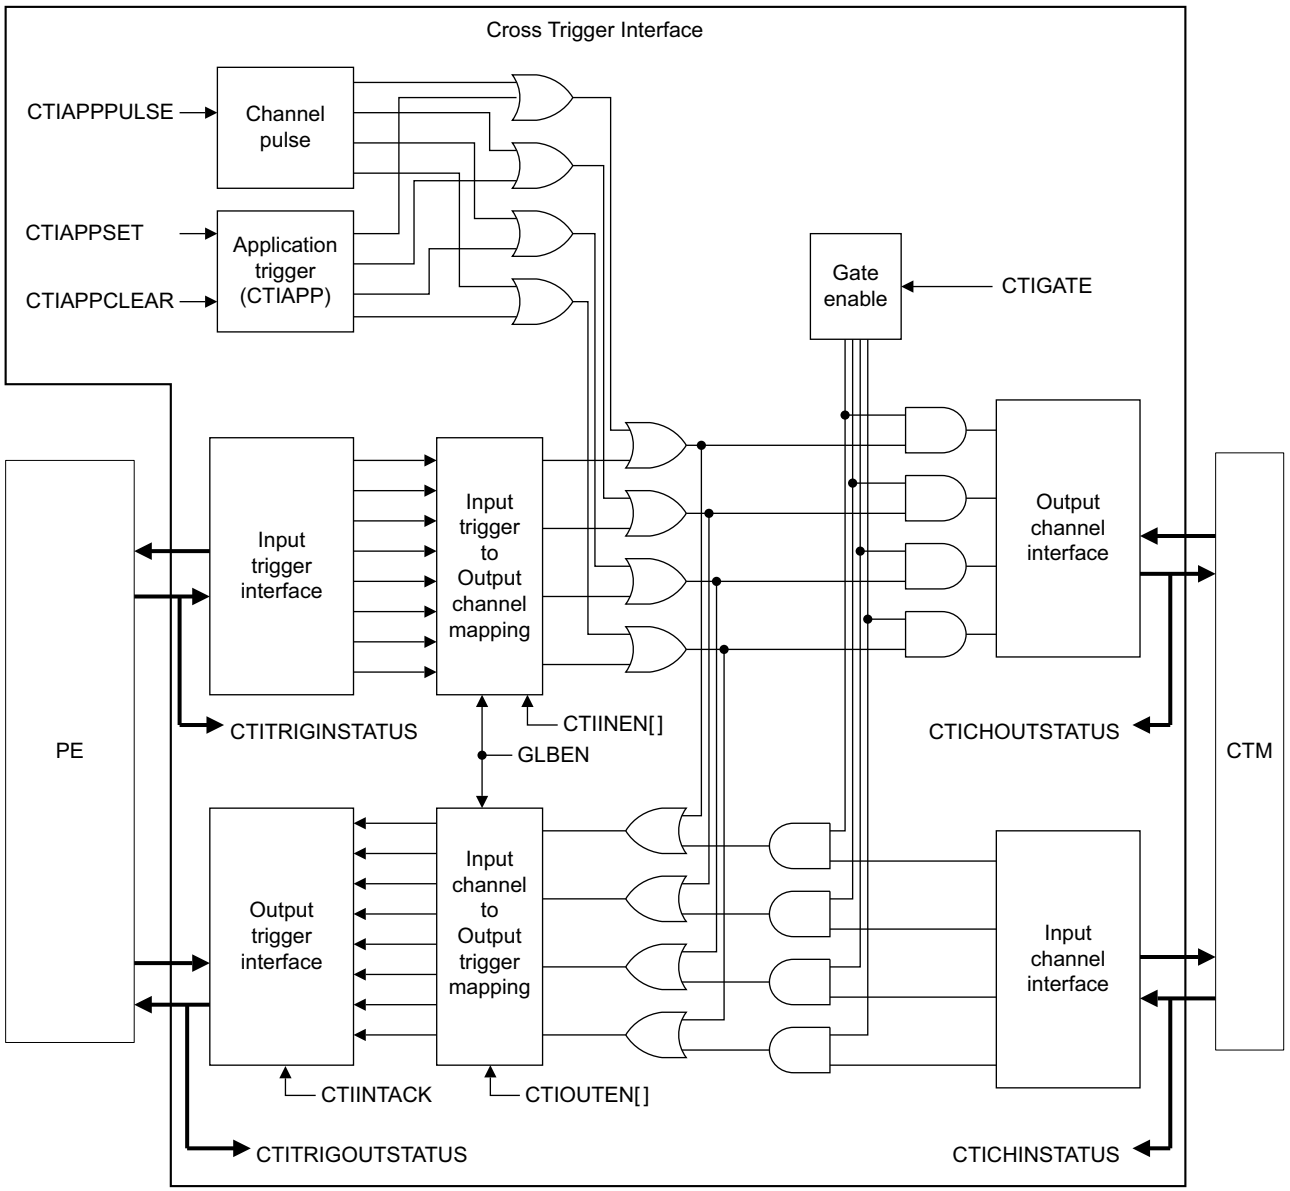

**Figure H5-2 Structure of a cross-trigger interface**

**Note**

- The number of triggers in IMPLEMENTATION DEFINED. Figure H5-2 shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. Figure H5-2 shows four channels.
- In Figure H5-2 the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the *mapping function* defined by the *Input trigger→output channel mapping registers*, CTIINEN<n>.

The CTI also contains an *application trigger* and *channel pulse* to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Channel events on each internal channel are passed to a corresponding output channel that is controlled by a *channel gate*. The channel gate can block propagation of channel events from an internal channel to an output channel.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the *cross-trigger matrix*, CTM. Therefore, the number of input channels must equal the number of output channels.

**Note**

The number of input triggers and output triggers is not required to be the same.

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the *Input channel → output trigger mapping registers*, CTIOUTEN<n>.

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:

- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See *Multicycle events*.

However, an output trigger is asserted until acknowledged. The output trigger can be:

- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of CTIINTACK.

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

**Note**

ARM recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

### H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

**Note**

A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

**Note**

The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

CTIAPPSET and CTIAPPCLEAR can set a channel active for multiple cycles. CTIAPPPULSE generates a single channel event. CTICHINSTATUS and CTICHOUTSTATUS can report whether a channel is active.

### An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

**Note**

A single event is typically a single cycle, but there is no guarantee that this is always the case.

CTIAPPSET and CTIAPPCLEAR can only generate a single channel event. CTIAPPPULSE generates a single channel event. If the ECT does not support multicycle channel events, use of CTIAPPSET and CTIAPPCLEAR is deprecated, and the debugger must only use CTIAPPPULSE. CTICHINSTATUS and CTICHOUTSTATUS must be treated as UNKNOWN.

Non-Confidential - Beta

## H5.3 Cross-triggers on a PE in an ARMv8 implementation

An ARMv8 PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the ARMv8-A PE, but can also connect to additional PEs. ARM strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes ARMv7-A PEs and other PEs that can be connected using a CoreSight CTI module.

**Note**

In a uniprocessor system the CTM is OPTIONAL. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. ARM recommends that the CTM is implemented.

Any CTI connected to a PE that is not an ARMv8-A PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the *CoreSight ™ SoC Technical Reference Manual*. ARMv8-A refines the generic CTI by defining roles for each of the implemented input and output triggers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H5.4 Description and allocation of CTI triggers

Table H5-1 shows the output trigger events defined by the architecture and the related trigger numbers.

**Table H5-1 Allocation of CTI output trigger events**

| Number | Source | Destination | Event description |
|---|---|---|---|
| 0 | CTI | PE | *Debug request trigger event* on page H5-4916 |
| 1 | CTI | PE | *Restart request trigger event* on page H5-4916 |
| 2 | CTI | IRQ controller | *Generic CTI interrupt trigger event* on page H5-4917 |
| 3 | - | - | Reserved |
| 4 - 7 | CTI | Trace extension | OPTIONAL *Generic trace external input trigger events* on page H5-4917 |

**Note**

Output triggers from the CTI are inputs to other blocks.

Table H5-2 shows the input trigger events defined by the architecture and the related trigger numbers.

**Table H5-2 Allocation of CTI input trigger events**

| Number | Source | Destination | Event description |
|---|---|---|---|
| 0 | PE | CTI | *Cross-halt trigger event* on page H5-4916 |
| 1 | PE | CTI | *Performance Monitors overflow trigger event* on page H5-4917 |
| 2 - 3 | - | - | Reserved |
| 4 - 7 | Trace extension | CTI | OPTIONAL *Generic trace external output trigger events* on page H5-4917 |

**Note**

Input triggers to the CTI are outputs from other blocks.

Table H5-1 and Table H5-2 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are only required if the OPTIONAL Trace extension is implemented. If the OPTIONAL Trace extension is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. ARM strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

An ARMv8-A implementation can extend the CTI with additional triggers. These start with the number eight.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[0].

**Note**

A debugger must poll CTITRIGOUTSTATUS[0] until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to CTIINTACK.

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also *External Debug Request debug event* on page H3-4878.

### H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is in Non-debug state, the request is ignored and dropped by the CTI.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is CONSTRAINED UNPREDICTABLE whether:

- The restart is ignored. In this case the PE enters Debug state and remains in Debug state.
- The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use EDPRSR.{SDR, HALTED} to determine the Execution state of the PE.

**Note**

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. *Debug request trigger event* describes how to do this.

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. See also *Exiting Debug state* on page H2-4858.

### H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

**Note**

To reduce the latency of halting, ARM recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, that might be derived from the Cross-halt trigger event, to be recorded in the EDSCR.STATUS field. This applies to Debug request trigger events that are acting as inputs to the PE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts a new Performance Monitors counter overflow interrupt request. See Chapter D5 *The Performance Monitors Extension*.

If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared by a write to PMOVSCLR_EL0. Otherwise, the trigger event is not asserted again until the overflow is cleared by a write to PMOVSCLR_EL0.

**Note**

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
- Events can be counted when `ExternalNoninvasiveDebugEnabled()` == FALSE, and, in Secure state, when `ExternalSecureNoninvasiveDebugEnabled()` == FALSE. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.

### H5.4.5 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL Trace extension, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL Trace extension.
- The OPTIONAL Trace extension and any other component attached to the CTM, including other Trace extensions.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to to remove the events.

### H5.4.6 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL Trace extension, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL Trace extension.
- The OPTIONAL Trace extension and any other component attached to the CTM, including other Trace extensions.

There are four Generic trace external output trigger events.

### H5.4.7 Generic CTI interrupt trigger event

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, Trace extension, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

**Note**

- ARM recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.
- GICv3 reserves a private peripheral interrupt number for this interrupt.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

It is IMPLEMENTATION DEFINED whether this trigger event is:

- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.
- Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[2]. This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

ARM recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.

## H5.5 CTI registers programmers' model

The CTI registers programmers' model is described in Chapter H8 *About the External Debug Registers*. The following sections contain information specific to the CTI:

- *External debug register resets* on page H8-4963.
- *External debug interface register access permissions* on page H8-4952.
- *Cross-trigger interface registers* on page H8-4961.
- The individual register descriptions in *Cross-Trigger Interface registers* on page H9-5054.

See also *Memory-mapped accesses to the external debug interface* on page H8-4950.

### H5.5.1 CTI reset

An External Debug reset resets the CTI. See *External debug register resets* on page H8-4963 for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

### H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

- CTITRIGINSTATUS shows the status of the input triggers and CTICHINSTATUS shows the status of the input channels, regardless of the value of `ExternalNoninvasiveDebugEnabled()`.

  **Note**

  The PE does not generate the Cross-halt trigger event and the Trace extension does not generate Generic trace external output trigger events when `ExternalNoninvasiveDebugEnabled()` == FALSE. However, the PE can generate Performance Monitors overflow trigger events.

- The CTI can generate external triggers regardless of the value of `ExternalInvasiveDebugEnabled()`.

  **Note**

  The PE ignores Debug request and Restart request trigger events when `ExternalInvasiveDebugEnabled()` == FALSE. The Trace extension ignores Generic trace external input trigger events when `ExternalNoninvasiveDebugEnabled()` == FALSE. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when `ExternalInvasiveDebugEnabled()` == FALSE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

  **Note**

  This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. ARM recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the Trace extension. They can do this:
  - To pass trace events between Trace extensions.
  - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the Trace extension.
  - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
  - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- *Halting a single PE*.
- *Halting all PEs in a group when any one PE halts* on page H5-4921.
- *Synchronously restarting a group of PEs* on page H5-4921.
- *Halting a single PE on Performance Monitors overflow* on page H5-4922.

**Example H5-1 Halting a single PE**

To halt a single PE, set:

1. CTIGATE[0] to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. CTIOUTEN0[0] to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

   **Note**

   The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of CTIOUTEN<n> for which <n> is 0.

3. CTIAPPPULSE[0] to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to CTIINTACK[0], before restarting the PE.

Non-Confidential - Beta

**Example H5-2 Halting all PEs in a group when any one PE halts**

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. CTIGATE[2] to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. CTIINEN0[2] to 1,so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. CTIOUTEN0[2] to 1, so that each CTI generates a Debug request trigger event in response to an channel event on channel 2.

   **Note**

   The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of CTIINEN<n> and CTIOUTEN<n> for which <n> is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1to CTIINTACK[0], before restarting the PE.

**Example H5-3 Synchronously restarting a group of PEs**

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
   a. Writing 1 to CTIINTACK[0] to clear the Debug request trigger event.
   b. Polling CTITRIGOUTSTATUS[0], until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set CTIGATE[1] to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set CTIOUTEN1[1] to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

   **Note**

   This example must use the instance of CTIOUTEN<n> for which <n> is 1.

4. Set CTIAPPPULSE[1] to 1 on any one PE in the group, to generate a channel event on channel 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Example H5-4 Halting a single PE on Performance Monitors overflow**

To halt a single PE on a Performance Monitors overflow set:

1. CTIGATE[3] to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.
2. CTIINEN1[3] to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

   **Note**

   This step of this example must use the instance of CTIINEN<n> for which <n> is 1.

3. CTIOUTEN0[3] to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

   **Note**

   This step of this example must use the instance of CTIOUTEN<n> for which <n> is 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to CTIINTACK[0], before restarting the PE. Clear the overflow status by writing to PMOVSCLR_EL0.

# Chapter H6
# Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- *About Debug over powerdown* on page H6-4924.
- *Power domains and debug* on page H6-4925.
- *Core power domain power states* on page H6-4926.
- *Emulating low-power states* on page H6-4928.
- *Debug OS Save and Restore sequences* on page H6-4930.
- *Reset and debug* on page H6-4935.

**Note**

Where necessary, Table K13-1 on page K13-5708 disambiguates the general register references used in this chapter.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H6.1 About Debug over powerdown

Debug over powerdown is a facility for an operating system to save and restore the PE state on behalf of a self-hosted or external debugger or both.

For external debug over powerdown, the architecture defines the OS Lock, OS Double Lock, and the logical split of the hardware on which a PE executes into the *Core power domain* and the *Debug power domain*. See:

- *Power domains and debug* on page H6-4925.
- *Core power domain power states* on page H6-4926.

Non-Confidential - Beta

## H6.2 Power domains and debug

The external debug component of ARMv8-A has two logical power domains, each with its own reset:

- The debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. Registers in this domain are reset by an external debug reset.
- The core power domain contains the rest of the PE, and is allowed to power up and power down independently of the Debug power domain.

The core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

**Note**

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers' model.
- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers' model is a valid implementation.

Figure H6-1 shows the recommended power domain split. The signals **DBGPWRUPREQ**, **DBGNOPWRDWN**, and **DBGPWRDUP** shown in Figure H6-1 provide an interface between the power controller and the PE debug logic that is in the debug power domain. They are part of the recommended interface. See Appendix K2 *Recommended External Debug Interface*.

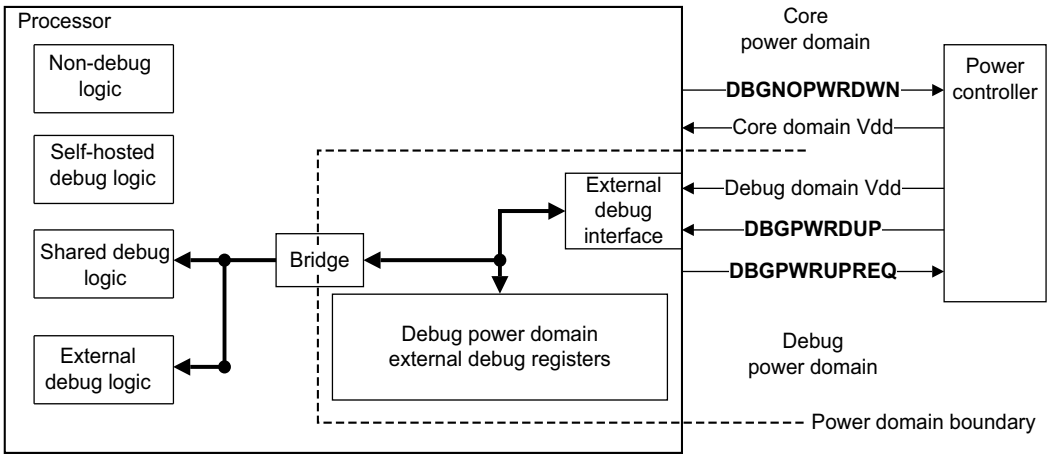

**Figure H6-1 Recommended power domain split between core and debug power domains**

## H6.3 Core power domain power states

The ARM architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. The Debug architecture uses a four logical power states model for the core power domain. The four logical power states are as follows:

**Normal** The core power domain is fully powered up and the debug registers are accessible.

**Standby** The core power domain is on, but there are measures to reduce energy consumption. In a typical implementation, the PE enters standby by executing a `WFI` or `WFE` instruction, and exits on a wake-up event. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby.

The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE.

Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:

- An External Debug Request debug event is a wake-up event when halting is allowed. This means that the PE must exit standby to handle the debug event. If the PE executed a `WFE` or a `WFI` instruction to enter standby, then it retires that instruction,
- If the external debug interface is accessed, the PE must respond to that access. ARM recommends that, if the PE executed a `WFI` or `WFE` instruction to enter standby, then it does not retire that instruction.

Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.

**Retention** The OS takes some measures, including IMPLEMENTATION DEFINED code sequences and registers, to reduce energy consumption. The PE state, including debug settings, is preserved in low-power structures, allowing the core power domain to be at least partially turned off.

Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a *software-visible retention state*. It is IMPLEMENTATION DEFINED whether the value of DBGPRCR.CORENPDRQ is set to the value of EDPRCR.COREPURQ on leaving the software-visible retention state.

External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.

**Note**

- This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.

**Powerdown** The OS takes some measures to reduce energy consumption by turning the core power domain off. These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown. Changing from powerdown to normal operation must include:

- A Cold reset of the PE after the power level has been restored.
- The OS restoring the saved PE state.

External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.

The Debug architecture uses a simpler two states model for the Debug power domain. The two states are:

**Off** The debug power domain is turned off.

**On** The debug power domain is turned on.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The available power states, including the cross-product of core power domain and debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

**Note**

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the debug power domain to be on when the core power domain is off.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H6.4 Emulating low-power states

The control registers DBGPRCR.CORENPDRQ and EDPRCR.COREPURQ provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface. With this interface the external debugger can request the power controller to:

- Emulate states where the core power domain is completely off or in a low-power state where the core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.
- Restore full power to the core power domain.

EDPRSR.{SPD, PU} indicates the core power domain power state. For more information see:

- *DBGPRCR_EL1, Debug Power Control Register* on page D7-2185 and *DBGPRCR, Debug Power Control Register* on page G6-4704.
- *EDPRCR, External Debug Power/Reset Control Register* on page H9-5030.
- *EDPRSR, External Debug Processor Status Register* on page H9-5033.
- Appendix K2 *Recommended External Debug Interface*.

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug registers in both the debug power domain and the core power domain as if the core power domain were on. That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence. To stop the OS Double Lock preventing access to debug registers when powerdown is being emulated, `DoubleLockStatus() == FALSE` when DBGPRCR.CORENPDRQ == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

Example H6-1 and Example H6-2 are examples of two approaches to emulating powerdown.

**Example H6-1 An example of emulating powerdown**

---

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

---

**Example H6-2 Another example of emulating powerdown**

---

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

---

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset.

**Note**

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, RMR_ELx is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.
- The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.

## H6.5 Debug OS Save and Restore sequences

In ARMv8-A, the following registers provide the OS Save and restore mechanism:

- The *OS Lock Access Register*, OSLAR, locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The *OS Lock Status Register*, OSLSR, shows the status of the OS Lock.
- The *External Debug Execution Control Register*, EDECR, can be configured to generate a debug event when the OS Lock is unlocked.
- The *OS Double Lock Register*, OSDLR, locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:

- *Reset and debug* on page H6-4935
- Appendix K8 *Example OS Save and Restore Sequences*

### H6.5.1 Debug registers to save over powerdown

Table H6-1 shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.
- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
  - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when OSLSR.OSLK is locked. These registers include OSECCR, OSDTRRX, and OSDTRTX.
- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. DBGVCR32_EL2 and SDER32_EL3 are only required to support AArch32.

Table H6-1 does not include registers for the OPTIONAL Trace and Performance Monitor extensions.

**Table H6-1 Debug registers to save over powerdown**

| Register in AArch64 | Register in AArch32 | Self-hosted | External |
|---|---|---|---|
| MDSCR_EL1 | DBGDSCRext | Yes | Yes[a] |
| DBGBVR<n>_EL1 | DBGBVR<n> | Yes | Yes |
| DBGBCR<n>_EL1 | DBGBCR<n> | Yes | Yes |
| DBGWVR<n>_EL1 | DBGWVR<n> | Yes | Yes |
| DBGWCR<n>_EL1 | DBGWCR<n> | Yes | Yes |
| DBGVCR32_EL2 | DBGVCR | Yes | - |
| MDCR_EL2 | HDCR | Yes | - |
| SDER32_EL3 | SDER | Yes | - |
| MDCR_EL3 | SDCR | Yes[b] | - |
| MDCCINT_EL1 | DBGDCCINT | - | Yes[b] |

**Table H6-1 Debug registers to save over powerdown (continued)**

| Register in AArch64 | Register in AArch32 | Self-hosted | External |
|---|---|---|---|
| DBGCLAIMSET_EL1<br>DBGCLAIMCLR_EL1 | DBGCLAIMSET,<br>DBGCLAIMCLR | - | Yes[c] |
| OSECCR_EL1 | DBGOSECCR | - | Yes[ab] |
| OSDTRRX_EL1<br>OSDTRTX_EL1 | DBGDTRRXext<br>DBGDTRTXext | - | Yes |

a. The OS Lock must be locked to save and restore for external debug. When the OS Lock is locked, DSCR is part of the software save and restore mechanism for external debug. It provides a mechanism for an operating system to access some fields of EDSCR that are otherwise read-only or not visible to software. This allows the operating system to save and restore these settings over a powerdown for the external debugger.

b. This register is new in ARMv8-A. Sequences written for ARMv7 do not preserve the register over powerdown.

c. Read DBGCLAIMCLR to save, write DBGCLAIMSET to restore.

### H6.5.2 OS Save sequence

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

1. Lock the OS Lock by:
   - Writing the key value `0xC5ACCE55` to the DBGOSLAR in AArch32 state.
   - Writing 1 to OSLAR_EL1.OSLK in AArch64 state.
2. Execute an `ISB` instruction.
3. Walk through the debug registers listed in *Debug registers to save over powerdown* on page H6-4930 and save the values to the nonvolatile storage.

Before removing power from the core power domain, software must:

1. Lock the OS Double Lock by writing 1 to OSDLR_EL1.DLK.
2. Execute a context synchronization operation.

### H6.5.3 OS Restore sequence

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. Lock the OS Lock, as described in *OS Save sequence*. The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
2. Execute an `ISB` instruction.
3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
   - Write 0 to MDSCR_EL1 if executing in AArch64 state.
   - Write 0 to DBGDSCRext if executing in AArch32 state.
4. Walk through the debug registers listed in *Debug registers to save over powerdown* on page H6-4930, and restore the values from the nonvolatile storage. The last register to be restored must be:
   - MDSCR_EL1 if executing in AArch64 state.
   - DBGDSCRext if executing in AArch32 state.
5. Execute an `ISB` instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

6. Unlock the OS Lock by:
   - Writing any non-key value to DBGOSLAR if executing in AArch32 state.
   - Writing 0 to OSLAR_EL1.OSLK if executing in AArch64 state.
7. Execute a context synchronization operation.

**Note**

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

### H6.5.4 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

- Access to debug registers through the System register interface is mainly unchanged except that:
  - Certain registers are read and written without side-effects.
  - Fields in DSCR and OSECCR that are normally read-only become read/write.

  This allows the state to be saved or restored. For more information, see the relevant register description in Chapter H9 *External Debug Register Descriptions*.
- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information see *External debug interface register access permissions summary* on page H8-4954.
- Debug exceptions, other than Software Breakpoint Instruction exceptions are not generated.

The OS Lock has no effect on Software Breakpoint Instruction debug events and Halting debug events.

### H6.5.5 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, an OS Unlock Catch debug event is generated if EDECR.OUCE is set to 1. See *OS Unlock Catch debug event* on page H3-4879.

### H6.5.6 Debug behavior when the OS Double Lock is locked

The OS Double Lock is locked immediately before a powerdown sequence. The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When `DoubleLockStatus()` == TRUE:

- The external debug interface only has restricted access to the debug registers, so that it is quiescent before removing power. See *External debug interface register access permissions summary* on page H8-4954.
- Debug exceptions, other than Software Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See *Halting allowed and halting prohibited* on page H2-4821.

  **Note**

  Pending Halting debug events might be lost when core power is removed.
- No asynchronous debug events are `WFI` or `WFE` wake-up events.

Software must synchronize the update to OSDLR before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the OSDLR update before issuing the `WFI` instruction.

OSDLR.DLK is ignored and `DoubleLockStatus()` == FALSE if either:

- The PE is in Debug state.
- DBGPRCR.CORENPDRQ is set to 1.

**Note**

It is possible to enter Debug state with OSDLR.DLK set to 1. This is because a context synchronization operation is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the OSDLR update is synchronized.

Because OSDLR.DLK is ignored when DBGPRCR.CORENPDRQ is set to 1, and an external debugger can write to DBGPRCR.CORENPDRQ, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. ARM deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, it is important to avoid race conditions that defeat this purpose. ARM recommends that:

- Once the write to OSDLR.DLK has been synchronized by a *Context synchronization operation* and `DoubleLockStatus()` == TRUE, a PE must:
  - Not allow a debug event generated before the *Context synchronization operation* to cause an entry to Debug state or act as a wake-up event for a `WFI` or `WFE` instruction after the context synchronization operation has completed.
  - Complete any external debug access started before the *Context synchronization operation* by the time the context synchronization operation completes.

    **Note**

    A debug register access might be in progress when software sets OSDLR.DLK to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets OSDLR.DLK to 1 must complete or return an error in finite time.

- If a write to DBGPRCR or EDPRCR made when OSDLR.DLK == 1 changes DBGPRCR.CORENPDRQ or EDPRCR.CORENPDRQ from 1 to 0, meaning `DoubleLockStatus()` changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for `DoubleLockStatus()` == TRUE listed in this section are met.

In the standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if `DoubleLockStatus()` == FALSE, an external debugger can clear the OS Lock at any time, and then write to EDPRCR.

The pseudocode for the `DoubleLockStatus()` function is as follows:

```
// DoubleLockStatus()
// ==================
// Returns the value of EDPRSR.DLK.
//    FALSE if OSDLR_EL1.DLK == 0 or DBGPRCR_EL1.CORENPDRQ == 1 or the PE is in Debug state.
//    TRUE if OSDLR_EL1.DLK == 1 and DBGPRCR_EL1.CORENPDRQ == 0 and the PE is in Non-debug state.

boolean DoubleLockStatus()

    if ELUsingAArch32(EL1) then
        return DBGOSDLR.DLK == '1' && DBGPRCR.CORENPDRQ == '0' && !Halted();
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
else
    return OSDLR_EL1.DLK == '1' && DBGPRCR_EL1.CORENPDRQ == '0' && !Halted();
```

## H6.6 Reset and debug

All registers in the Core power domain are reset either by a Warm reset or a Cold reset, as described in *Reset* on page D1-1533, including external debug logic registers.

All registers in the Debug power domain are reset by an External Debug reset.

Figure H6-2 shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:

- **CORERESET**, which must be asserted for a Warm reset.
- **CPUPORESET**, which must be asserted for a Cold reset.
- **PRESETDBG**, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

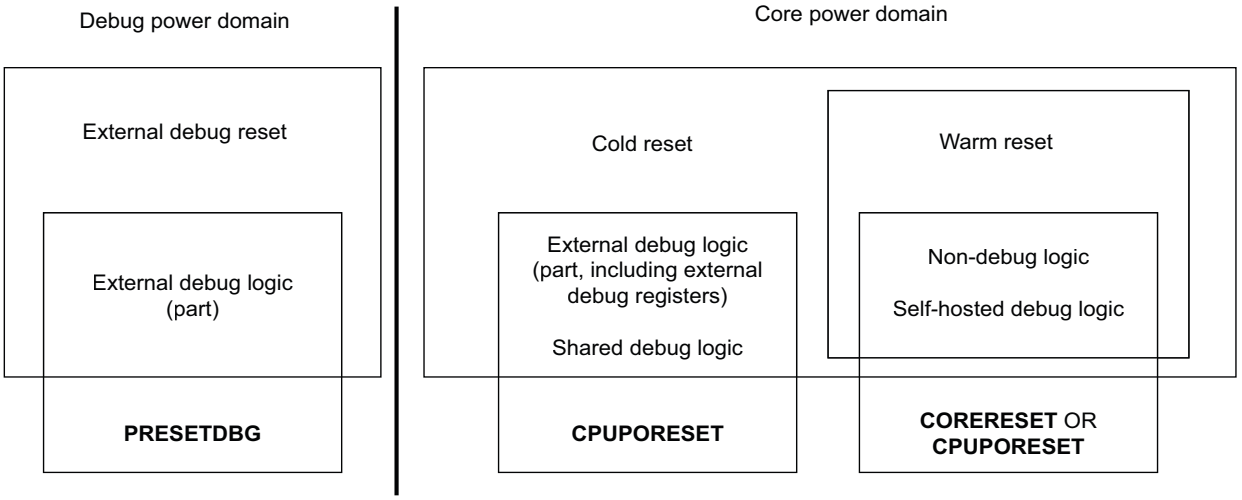

**Figure H6-2 Power and reset domains**

For more information about power domains and power states, see *Power domains and debug* on page H6-4925.

When power is first applied to the Debug power domain, **PRESETDBG** must be asserted.

When power is first applied to the Core power domain, **CPUPORESET** must be asserted.

**Note**

In this scheme, logic in the Warm reset domain is reset by asserting either **CORERESET** or **CPUPORESET**. This implies a particular implementation style that permits these approaches.

**CPUPORESET** is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also *Emulating low-power states* on page H6-4928 and *EDPRSR, External Debug Processor Status Register* on page H9-5033.

### H6.6.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:
  - Then, if the register or register field is reset by that reset signal, it is CONSTRAINED UNPREDICTABLE whether the register or register field takes the reset value or the value written. The reset value might be UNKNOWN.
  - Otherwise the register or register field takes the value that is written.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Reads a register, or indirectly reads a register or register field, as part of an access:
  - Then, if the register or register field is reset by that reset signal, the value returned in UNKNOWN.
  - Otherwise, the value of the register or register field is returned.

It is IMPLEMENTATION DEFINED whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is IMPLEMENTATION DEFINED.

*Non-Confidential - Beta*

# Chapter H7
# The Sample-based Profiling Extension

This chapter describes the Sample-based Profiling Extension, that is an OPTIONAL extension to the ARMv8 architecture. The extension provides a non-invasive external debug component.

**Note**

This form of the Sample-based Profiling Extension is OPTIONAL. ARM recommends that if extension EDPCSR is not implemented that an alternative IMPLEMENTATION DEFINED form of Sample-based Profiling is implemented.

It contains the following section:

- *Sample-based profiling* on page H7-4938.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H7.1 Sample-based profiling

Sample-based Profiling is an OPTIONAL extension to the architecture. It provides a mechanism for coarse-grained profiling of software executing on the PE by an external debugger, without changing the behavior of that software. The following sections describe this extension:

- *The implemented Sample-based profiling registers*.
- *Reads of the External Debug Program Counter Sampling Registers*.
- *Reads of the External Debug Virtual Context Sample Register* on page H7-4939.
- *Accuracy of sampling* on page H7-4939.
- *Sample-based Profiling and security* on page H7-4940.
- *Pseudocode description of Sample-based Profiling* on page H7-4940.

### H7.1.1 The implemented Sample-based profiling registers

An implementation that includes the Sample-based Profiling Extension implements the following external debug registers:

- EDPCSR is a 64-bit read-only register that contains a sampled program counter value. As external debug register accesses are atomic only at word granularity, EDPCSR is split into two registers: EDPCSRhi and EDPCSRlo. See *Reads of the External Debug Program Counter Sampling Registers*.
- EDCIDSR is a read-only register that contains the sampled value of CONTEXTIDR_EL1 indirectly read on reading EDPCSRlo.

  **Note**

  If EL3 is implemented and using AArch32, then CONTEXTIDR is a Banked register and EDCIDSR samples the current Banked copy of CONTEXTIDR.

- EDVIDSR is a read-only register that contains sampled values captured on reading EDPSRlo. If neither EL3 nor EL2 are implemented, EDVIDSR is not implemented.

### H7.1.2 Reads of the External Debug Program Counter Sampling Registers

A read of the EDPCSRlo normally has the side-effect of indirectly writing to EDCIDSR, EDVIDSR, and EDPCSRhi. When EDPCSRlo is read, the bottom 32 bits of a program counter sample are returned. The top 32 bits are captured in EDPCSRhi and can be read later. However:

- If the PE is in Debug state, or Sample-based Profiling is prohibited, EDPCSRlo reads as `0xFFFFFFFF` and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN. See *Sample-based Profiling and security* on page H7-4940.
- If the PE is in Reset state, the sampled value is UNKNOWN and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN.
- If no instruction has been retired since the PE left Reset state, Debug state, or a state where Sample-based Profiling is prohibited, the sampled value is UNKNOWN and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN.
- The indirect writes to EDCIDSR, EDVIDSR, and EDPCSRhi might not occur for a memory-mapped access to the external debug interface. For more information, see *Memory-mapped accesses to the external debug interface* on page H8-4950.

The value written to EDCIDSR is an indirect read of CONTEXTIDR_EL1. This means that it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if a read of the EDPCSRlo samples:

- An instruction that writes to CONTEXTIDR_EL1.
- The next context synchronization operation.
- Any instruction executed between these two instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

In ARMv7 Sample-based Profiling Extension, an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. In the ARMv8 Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

### H7.1.3 Reads of the External Debug Virtual Context Sample Register

A read of the EDVIDSR contains sampled values captured on reading EDPSRlo, where:

- EDVIDSR.NS indicates the Security state associated with the most recent EDPCSR sample.
- EDVIDSR.E2 indicates whether the most recent EDPCSR sample was associated with EL2. If EDVIDSR.NS == 0, this bit is 0.
- EDVIDSR.E3 indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64. If EDVIDSR.NS == 1 or the PE was in AArch32 state when EDPCSRlo was read, this bit is 0.
- EDVIDSR.HV indicates whether EDPCSRhi is valid, that is, bits [63:32] of the most recent program counter sample are nonzero.

  **Note**

  — EDVIDSR.HV == 1 does not mean that EDPCSRhi != 0. EDVIDSR.HV == 0 is a hint that EDPCSRhi does not need to be read.

  — Tools must take care to avoid skewing sampled data by over-sampling code for which EDVIDSR.HV == 0.

- EDVIDSR.VMID indicates the value of the VTTBR_EL2.VMID register associated with the most recent EDPCSRlo sample. If EDVIDSR.NS == 0 or EDVIDSR.E2 == 1, this field is RAZ.

If EL2 is not implemented, EDVIDSR.E2 and EDVIDSR.VMID are RES0.

If EL3 is not implemented, EDVIDSR.E3 is RES0, and EDVIDSR.NS has a fixed read-only value.

### H7.1.4 Accuracy of sampling

Sample-based Profiling is provided as a mechanism for tools to populate a statistical model of the performance of software executing on the PE. The statistical data returned by random sampling of EDPCSR, EDCIDSR, and EDVIDSR must allow such statistical modeling.

It must be possible to sample references to branch targets. It is IMPLEMENTATION DEFINED whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

Under normal operating conditions, the whole sample, EDPCSR, EDCIDSR, and EDVIDSR, must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. ARM does not define *a reasonable degree of inaccuracy* but recommends the following guidelines:

- In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.
- Under very unusual non-repeating pathological cases the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.

See also *Non-invasive behavior* on page D5-1859.

### H7.1.5 Sample-based Profiling and security

Sample-based Profiling is a non-invasive external debug component, which is controlled by an IMPLEMENTATION DEFINED authentication interface. Sample-based Profiling is prohibited unless both:

- Allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalNoninvasiveDebugEnabled()`
- Any one of:
  - Executing in Non-secure state.
  - EL3 is not implemented.
  - EL3 is implemented, executing in Secure state, and allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.
  - EL3 is implemented, EL3 or EL1 is using AArch32, executing at EL0 in Secure state, and SDER32_EL3.SUNIDEN == 1.

The state of IMPLEMENTATION DEFINED authentication interface is visible through DBGAUTHSTATUS_EL1.

See also Appendix K2 *Recommended External Debug Interface*.

### H7.1.6 Pseudocode description of Sample-based Profiling

`PCSample()` records a PC sample for the EDPCSR and associated registers.

```
type PCSample is (
    boolean valid,
    bits(64) pc,
    bits(2) el,
    bit rw,
    bit ns,
    bits(32) contextidr,
    bits(8) vmid
)

PCSample pc_sample;
// CreatePCSample()
// ================

CreatePCSample()
    // In a simple sequential execution of the program, CreatePCSample is executed each time the PE
    // executes an instruction that can be sampled. An implementation is not constrained such that
    // reads of EDPCSRlo return the current values of PC, etc.
    enabled = (if IsSecure() then ExternalSecureNoninvasiveDebugEnabled()
                             else ExternalNoninvasiveDebugEnabled());

    pc_sample.valid = enabled && !Halted();
    pc_sample.pc = ThisInstrAddr();
    pc_sample.el = PSTATE.EL;
    pc_sample.rw = if UsingAArch32() then '0' else '1';
    pc_sample.ns = if IsSecure() then '0' else '1';
    pc_sample.contextidr = if ELUsingAArch32(EL1) then CONTEXTIDR else CONTEXTIDR_EL1;
    if HaveEL(EL2) && !IsSecure() then
        pc_sample.vmid = if ELUsingAArch32(EL2) then VTTBR.VMID else VTTBR_EL2.VMID;

    return;

// EDPCSRlo[] (read)
// =================

bits(32) EDPCSRlo[boolean memory_mapped]

    if EDPRSR<6:5,0> != '001' then                      // Check DLK, OSLK and PU bits
        IMPLEMENTATION_DEFINED "signal slave-generated error";
        return bits(32) UNKNOWN;

    // The Software lock is OPTIONAL.
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
update = !memory_mapped || EDLSR.SLK == '0';        // Software locked: no side-effects

if pc_sample.valid then
    sample = pc_sample.pc<31:0>;
    if update then
        EDPCSRhi = (if pc_sample.rw == '0' then Zeros(32) else pc_sample.pc<63:32>);
        EDCIDSR = pc_sample.contextidr;
        EDVIDSR.VMID = (if HaveEL(EL2) && pc_sample.ns == '1' && pc_sample.el IN {EL1,EL0}
                        then pc_sample.vmid else Zeros(8));
        EDVIDSR.NS = pc_sample.ns;
        EDVIDSR.E2 = (if pc_sample.el == EL2 then '1' else '0');
        EDVIDSR.E3 = (if pc_sample.el == EL3 then '1' else '0') AND pc_sample.rw;
        // The conditions for setting HV are not specified if PCSRhi is zero.
        // An example implementation may be "pc_sample.rw".
        EDVIDSR.HV = (if !IsZero(EDPCSRhi) then '1' else bit IMPLEMENTATION_DEFINED "0 or 1");
else
    sample = Ones(32);
    if update then
        EDPCSRhi = bits(32) UNKNOWN;
        EDCIDSR = bits(32) UNKNOWN;
        EDVIDSR = (bits(4) UNKNOWN):Zeros(20):(bits(8) UNKNOWN);

return sample;

# Chapter H8
# About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- *Relationship between external debug and System registers* on page H8-4944.
- *Supported access sizes* on page H8-4945.
- *Synchronization of changes to the external debug registers* on page H8-4946.
- *Memory-mapped accesses to the external debug interface* on page H8-4950.
- *External debug interface register access permissions* on page H8-4952.
- *External debug interface registers* on page H8-4956.
- *Cross-trigger interface registers* on page H8-4961.
- *External debug register resets* on page H8-4963.

**Note**

Where necessary Table K13-1 on page K13-5708 disambiguates the general register references used in this chapter.

*Non-Confidential - Beta*

## H8.1 Relationship between external debug and System registers

Table H8-1 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

**Table H8-1 Equivalence between external debug and System registers**

| | System register | | |
|---|---|---|---|
| **External debug register** | **AArch64** | **AArch32** | **Notes** |
| DBGDTRRX_EL0 | DBGDTRRX_EL0 | DBGDTRRXint | See also *Summary of System register accesses to the DCC* on page H4-4897 |
| DBGDTRTX_EL0 | DBGDTRTX_EL0 | DBGDTRTXint | |
| OSLAR_EL1 | OSLAR_EL1 | DBGOSLAR | - |
| DBGBVR<n>_EL1[31:0]<br>DBGBVR<n>_EL1[63:32] | DBGBVR<n>_EL1[31:0]<br>DBGBVR<n>_EL1[63:32] | DBGBVR<n><br>DBGBXVR<n> | - |
| DBGBCR<n>_EL1 | DBGBCR<n>_EL1 | DBGBCR<n> | - |
| DBGWVR<n>_EL1[31:0]<br>DBGWVR<n>_EL1[63:32] | DBGWVR<n>_EL1[31:0]<br>DBGWVR<n>_EL1[63:32] | DBGWVR<n> | - |
| DBGWCR<n>_EL1 | DBGWCR<n>_EL1 | DBGWCR<n> | - |

| DBGCLAIMCLR_EL1 | DBGCLAIMCLR_EL1 | DBGCLAIMCLR | - |
| DBGAUTHSTATUS_EL1 | DBGAUTHSTATUS_EL1 | DBGAUTHSTATUS | Read-only |
| EDSCR | MDSCR_EL1 | DBGDSCRext | Only some fields map |
| EDECCR | OSECCR_EL1 | DBGOSECCR | Applies when the OS Lock is locked. |
| MIDR_EL1 | MIDR_EL1 | MIDR | Read-only copies of Processor ID Registers |
| EDDEVAFF0<br>EDDEVAFF1 | MPIDR_EL1[31:0][a]<br>MPIDR_EL1[63:32][a] | MPIDR | Read-only copies of system ID registers |

a. This is a word of a 64-bit register.

In addition:

- EDSCR.{TXfull, RXfull} are read-only aliases for DCCSR.{TXfull, RXfull}.
- EDPRCR.CORENPDRQ is a read/write alias for DBGPRCR.CORENPDRQ.
- EDPRSR.OSLK is a read-only alias for OSLSR.OSLK.
- EDPRSR.DLK is a read-only function of OSLSR.DLK.

## H8.2 Supported access sizes

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitor registers, and CTI registers, implementations must support:

- Word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations.
- Doubleword-aligned 64-bit accesses to access 64-bit registers mapped to a doubleword-aligned pair of adjacent 32-bit locations.

**Note**

This means that a system implementing the debug registers using a 32-bit bus, such as a AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte.
- Halfword.
- Unaligned word. These accesses are not word single-copy atomic.
- Unaligned doubleword. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair forming a 64-bit register.
- Quadword or higher.
- Exclusive accesses.

For each of these access types, it is CONSTRAINED UNPREDICTABLE whether:

- The access generates an external abort or not.
- The defined side-effects of a read occur or not. A read returns UNKNOWN data.
- A write is ignored or sets the accessed register or registers to UNKNOWN.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADIv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.

See *Access sizes for memory-mapped accesses* on page H8-4951.

## H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- *Synchronization and debug exceptions* on page D2-1701 for exceptions taken from AArch64 state, or *Synchronization and debug exceptions* on page G2-3945 for exceptions taken from AArch32 state.
- *Synchronization and Halting debug events* on page H3-4882.
- *Synchronization of DCC and ITR accesses* on page H4-4897.

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

**Note**

*Synchronization requirements for System registers* on page D7-1908 defines direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, and DBGWVR<n>_EL1, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

*Synchronization of DCC and ITR accesses* on page H4-4897 describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the master of the authentication interface. See *Synchronization and the authentication interface* on page H8-4947.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible only in the external debug interface.

Some registers are guaranteed to be observable to all observers in finite time, without explicit synchronization. For more information, see *Synchronization requirements for System registers* on page D7-1908. Otherwise, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a context synchronization operation.
- The context synchronization operation was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by *Synchronization requirements for System registers* on page D7-1908.

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a `DSB` barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

For an external Debug Access Port, this is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, a write is guaranteed to complete before the APB-AP allows a second APB transaction to complete.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the context synchronization operation, and relying on the memory ordering rules provided by the memory model.

External reads and external writes complete in the order in which they arrive at the PE. For accesses to different register locations the external agent must create this order by:

- Marking the memory as Device-nGnRnE or Device-nGnRE.
- Using the appropriate memory barriers.
- Some guaranteed property of the connection between the PE and the external agent.

**Note**

For an external Debug Access Port, this is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an `ISB` instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an `ISB` instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to EDITR.

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, DBGBCR<n>_EL1 and DBGBVR<n>_EL1.
- The watchpoint registers, DBGWCR<n>_EL1 and DBGWVR<n>_EL1.

This guarantee only applies to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example EDSCR, or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

**Note**

This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in *Examples of the synchronization of changes to the external debug registers* on page H8-4948.

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and System register access include DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, PMCR_EL0.{C,P}, PMOVSSET_EL0, PMOVSCLR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, and PMSWINC_EL0. This last register is OPTIONAL and deprecated in the external debug interface.

### H8.3.1 Synchronization and the authentication interface

Changes to the authentication interface are indirect writes to the Authentication Status registers by the master of the authentication interface. For each of these Authentication Status registers, it is IMPLEMENTATION DEFINED whether a change on the authentication interface is guaranteed to be observable to an external debug interface read of the register only after a context synchronization operation or in finite time.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For DBGAUTHSTATUS_EL1, a change on the authentication interface is guaranteed to be observable to a System register read of DBGAUTHSTATUS_EL1 only after a context synchronization operation.

### H8.3.2 Examples of the synchronization of changes to the external debug registers

Example H8-1, Example H8-2, and Example H8-3 show the synchronization of changes to the external debug registers.

**Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes**

Initially DBGBVR<n>_EL1 is `0x8000` and DBGBCR<n>_EL1 is `0x0181`. This means that a breakpoint is enabled on the halfword T32 instruction at address `0x8000`.

A sequence of external writes occurs in the following order:

1. `0x0000` is written to DBGBCR<n>_EL1, disabling the breakpoint.
2. `0x9000` is written to DBGBVR<n>_EL1[31:0].
3. `0x0061` is written to DBGBCR<n>_EL1, enabling a breakpoint on the halfword at address `0x9002`.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address `0x8002` and `0x9000`.

Similarly a breakpoint or watchpoint must be disabled:

- If both halves of a 64-bit address have to be updated.
- If any of the DBGBCR<n>_EL1 or DBGWCR<n>_EL1 fields are modified at the same time as updating the address.

**Example H8-2 Simultaneous accesses to DTR registers**

Initially EDSCR.{TXfull, TXU, ERR} are 0. Then:

- `0x0DCCDA7A` is directly written to DBGDTRTX_EL0 by an `MSR` instruction.
- DBGDTRTX_EL0 is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of `0x0DCCDA7A` to DBGDTRTX_EL0 is handled first, then:

- The external debug interface read of DBGDTRTX_EL0 clears EDSCR.TXfull to 0.
- EDSCR.{TXU, ERR} are unchanged.
- The external debug interface read returns `0x0DCCDA7A`.

If the indirect read of DBGDTRTX_EL0 by the external debug interface is handled first, then:

- The external debug interface read of DBGDTRTX_EL0 causes an underrun and as a result EDSCR.{TXU, ERR} are both set to 1.
- The external debug interface returns an UNKNOWN value.
- Writing `0x0DCCDA7A` to DBGDTRTX_EL0 sets DTRTX to `0x0DCCDA7A` and EDSCR.TXfull to 1.

**Example H8-3 Simultaneous writes to CLAIM registers**

Initially all CLAIM tag bits are 0. Then:

- `0x01` is written to DBGCLAIMSET_EL1 by a direct write, followed by an explicit context synchronization operation.
- `0x02` is written to DBGCLAIMSET_EL1 by an external write.

These events might happen at the same time and in either order.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

After this:

- DBGCLAIMCLR_EL1 is read by a direct read.
- DBGCLAIMCLR_EL1 is read by an external read.

In this case, a direct read can return either `0x01` or `0x03`, and the external read can return either `0x02` or `0x03`.

The only permitted final result for the CLAIM tags is the value `0x03`, because this would be the result regardless of whether `0x01` or `0x02` is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See *Synchronization requirements for System registers* on page D7-1908.

It is not possible for a direct read to return `0x01` and the external read to return `0x02`, because the writes to DBGCLAIMCLR_EL1 are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value `0x03`, and then, at the same time, two writes occur:

- `0x04` is written to DBGCLAIMSET_EL1 by a direct write, followed by an explicit context synchronization operation.
- `0x01` is written to DBGCLAIMCLR_EL1 by an external write.

In this case only permitted final result for the CLAIM tags is the value `0x06`.

## H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component. The Software Locks are controlled by EDLSR and EDLAR, PMLSR and PMLAR, and CTILSR and CTILAR. See *Management registers and CoreSight compliance* on page K2-5523.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

**Note**

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in ARMv7. In particular:

- The memory map is different.
- Memory-mapped accesses do not behave differently to Debug Access Port accesses when OSLSR.OSLK == 1, meaning that the OS Lock is locked.

### H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If memory-mapped accesses are made through an ADIv5 interface, the Debug Access Port can block the access using **DBGSWENABLE**. This is outside the scope of the ARMv8-A architecture. See *ARM® Debug Interface Architecture Specification ADIv5.0 to ADIv5.2*.

#### Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and EDLSR.SLK, PMLSR.SLK, or CTILSR.SLK is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
  - Read/write (RW) registers become read-only (RO).
  - Write-only (WO) registers become write-ignored (WI).
- Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.
- Writes to EDLAR, PMLAR, and CTILAR are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if EDLSR.SLK is set to 1:

- EDSCR.{TXfull, TXU, ERR} are unchanged by a memory-mapped read from DBGDTRTX_EL0.
- EDSCR.{RXfull, RXO, ERR} are unchanged by a memory-mapped write to DBGDTRRX_EL0 that is ignored.
- EDSCR.{ITE, ITO, ERR} are unchanged by a memory-mapped write to EDITR that is ignored.
- OSLSR.OSLK is unchanged by a memory-mapped write to OSLAR_EL1 that is ignored.
- EDPCSR[63:32], EDCIDSR, and EDVIDSR are unchanged by a memory-mapped read from EDPCSR[31:0].

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

Updating EDVIDSR, EDCIDSR, and EDPCSRhi are side-effects of reading EDPCSRlo, such that these registers contain the matching context for EDPCSRlo. The process that updates EDPCSRlo with PC samples is not a side-effect of the access. Reads of EDPCSRlo made when the Software Lock is locked can be used to profile software.

- EDPRSR.{SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from EDPRSR.
- EDPRSR.SDAD is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the EDAD field.
- The CLAIM tags are unchanged by memory-mapped writes to DBGCLAIMSET_EL1 and DBGCLAIMCLR_EL1 which are ignored.

Similarly, if PMLSR.SLK is set to 1, then EDPRSR.SPMAD is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the EPMAD field.

#### Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

ARM recommends that the error is returned as either:

- A synchronous external Data Abort.
- An SError interrupt.

### H8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in *Synchronization of changes to the external debug registers* on page H8-4946.

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.

### H8.4.3 Access sizes for memory-mapped accesses

For memory-mapped accesses from a PE that complies with an ARM architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory accessed, determine the size of the access made by an instruction. Example H8-4 shows this.

**Example H8-4 Access sizes for memory-mapped accesses**

Two Load Doubleword instructions made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

ARMv8 does not require the size of each element accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Any memory-mapped access to a debug register is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory-type and use only single register load and store instructions to create memory accesses that are supported by the peripheral. For more information, see *Memory types and attributes* on page B2-93.

## H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- OSLSR.OSLK == 1. The OS Lock is locked.
- `DoubleLockStatus()` == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.
- Access by the external debug interface is disabled by the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For details, see *External debug interface register access permissions summary* on page H8-4954.

**Note**

OSLSR.OSLK is visible through EDPRSR.

### H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- OSLSR.OSLK == 1, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.

  **Note**

  In this case OSLAR_EL1 can be accessed, meaning an external debugger can override this lock.

- `DoubleLockStatus()` == TRUE. This means that the OS Double Lock is locked and EDPRSR.DLK == 1. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

See also *Debug registers to save over powerdown* on page H6-4930.

### H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then SDCR provides additional external access disable controls for those registers if Secure external invasive debugging is disabled.

The disable applies to:

- *DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15* on page H9-4973.
- *DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15* on page H9-4970.
- *DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15* on page H9-4987.
- *DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15* on page H9-4984.

The external debug interface cannot access these registers if either:

- External debugging is not enabled. `ExternalInvasiveDebugEnabled()` == FALSE.
- Secure external debugging is not enabled, meaning `ExternalSecureInvasiveDebugEnabled()` == FALSE, and any of the following:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented and SDCR.EDAD == 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The following pseudocode outlines the AllowExternalDebugAccess() function.

```
// AllowExternalDebugAccess()
// ==========================
// Returns the status of EDPRSR.EDAD.

boolean AllowExternalDebugAccess()
    // The access may also be subject to OS lock, power-down, etc.
    if ExternalInvasiveDebugEnabled() then
        if ExternalSecureInvasiveDebugEnabled() then
            return TRUE;
        elsif HaveEL(EL3) then
            return (if ELUsingAArch32(EL3) then SDCR.EDAD else MDCR_EL3.EDAD) == '0';
        else
            return !IsSecure();
    else
        return FALSE;
```

PEs might also provide an OPTIONAL external debug interface to the Performance Monitor registers. The authentication interface and SDCR provide similar external access disable controls for those registers.

The external debug interface cannot access the Performance Monitor registers if either:

- External non-invasive debug is not enabled. ExternalNoninvasiveDebugEnabled() == FALSE.
- Secure external non-invasive debugging is not enabled, ExternalSecureNoninvasiveDebugEnabled() == FALSE, and any of:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented and SDCR.EPMAD == 1.

The following pseudocode outlines the AllowExternalPMUAccess() function.

```
// AllowExternalPMUAccess()
// ========================
// Returns the status of EDPRSR.EPMAD.

boolean AllowExternalPMUAccess()
    // The access may also be subject to OS lock, power-down, etc.
    if ExternalNoninvasiveDebugEnabled() then
        if ExternalSecureNoninvasiveDebugEnabled() then
            return TRUE;
        elsif HaveEL(EL3) then
            return (if ELUsingAArch32(EL3) then SDCR.EPMAD else MDCR_EL3.EPMAD) == '0';
        else
            return !IsSecure();
    else
        return FALSE;
```

**Note**

- ARM recommends that secure software that is not making use of debug hardware does not lock out the external debug interface.
- ARMv8-A does not provide the equivalent control over access to Trace extension registers.

### H8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIv5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in EDPRSR is indirectly written to 1 as a side-effect of the access:

- For a debug register access when `AllowExternalDebugAccess()` == FALSE, EDPRSR.SDAD is indirectly written to 1.
- For Performance Monitor register access when `AllowExternalPMUAccess()` == FALSE, EDPRSR.SPMAD is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see *Register access permissions for memory-mapped accesses* on page H8-4950.

If no error is returned, or the error is returned because of a higher priority error condition, the flag in EDPRSR is unchanged.

See also *Behavior of a not permitted memory-mapped access* on page H8-4951.

For more information, see *ARM® Debug Interface Architecture Specification*.

### H8.5.4 Trapping software access to debug registers

When EDSCR.TDA == 1, software access to the breakpoint and watchpoint registers generate a Halting debug event and entry to Debug state. For more information see *Software Access debug event* on page H3-4881.

### H8.5.5 External debug interface register access permissions summary

For accesses to:

- IMPLEMENTATION DEFINED registers, see *IMPLEMENTATION DEFINED registers*.
- OPTIONAL registers for CoreSight compliance, see *OPTIONAL CoreSight management registers*.
- Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see *Reserved and unallocated registers*.

For all other external debug interface, CTI, and Performance Monitor registers, Table H8-3 on page H8-4959, Table H8-4 on page H8-4961 and Table I2-1 on page I2-5113, show the response of the PE to accesses by the external debug interface.

### H8.5.6 IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, IMPLEMENTATION DEFINED register access permissions are IMPLEMENTATION DEFINED. The power domain in which these registers are implemented is also IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers. In particular, if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects. For more information see *Register access permissions for memory-mapped accesses* on page H8-4950.

### H8.5.7 OPTIONAL CoreSight management registers

Compliance with CoreSight architecture requires additional registers in the range `0xF00 - 0xFFC` that are always accessible. See *Management registers and CoreSight compliance* on page K2-5523.

### H8.5.8 Reserved and unallocated registers

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
  - OPTIONAL features that are not implemented.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

— Breakpoints and watchpoints that are not implemented.
— Performance Monitors counters that are not implemented.
— CTI triggers that are not implemented.

These accesses are reserved.

- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

**Note**

Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- If the implementation is CoreSight architecture compliant, all reserved registers in the range `0xF00 - 0xFFC`. See *Management register access permissions* on page K2-5524.
- All unallocated Processor ID Registers. That is, unallocated debug registers in the range `0xD00-0xDFC`.
- All reserved CTI registers.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:

   **Off** The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.

   **DLK** `DoubleLockStatus()` == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.

   **OSLK** OSLSR.OSLK == 1. The OS Lock is locked.

3. In addition, for reserved debug registers in the address ranges `0x400 - 0x4FC` and `0x800 - 0x8FC`, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

   **EDAD** `AllowExternalDebugAccess()` == FALSE. External debug is disabled.

   **Note**

   See also *Behavior of a not permitted access* on page H8-4953.

4. In addition, for reserved Performance Monitors registers in the address ranges `0x000 - 0x0FC` and `0x400 - 0x47C`, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

   **EPMAD** `AllowExternalPMUAccess()` == FALSE. External Performance Monitor access is disabled.

   **Note**

   See also *Behavior of a not permitted access* on page H8-4953.

### H8.6.1 Access permissions for the External debug interface registers

Table H8-3 on page H8-4959 shows the access permissions for the external debug interface registers in an ARMv8-A Debug implementation. The terms are defined as follows:

**Domain** This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.

**Conditions** This lists the conditions under which the access is attempted.

To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true.

The conditions are:

**Off** EDPRSR.PU == 0. The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed.

**Note**

If debug power is off, then all external debug interface accesses return an error.

**DLK** `DoubleLockStatus()` == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.

**OSLK** OSLSR.OSLK == 1. The OS Lock is locked.

**EDAD** `AllowExternalDebugAccess()` == FALSE. External debug access is disabled. See also *Behavior of a not permitted access* on page H8-4953.

**EPMAD** `AllowExternalPMUAccess()` == FALSE. Access to the external Performance Monitors is disabled. See also *Behavior of a not permitted access* on page H8-4953.

**Default** This provides the default access permissions, if there are no conditions that prevent access to the register.

**SLK** This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See *Register access permissions for memory-mapped accesses* on page H8-4950. For all other accesses, this column is ignored.

The access permissions are:

**-** This means that the default access permission applies. See the Default column, or the SLK column, if applicable.

**RO** This means that the register or field is read-only.

**RW** This means that the register or field is read/write. Individual fields within the register might be RO. See the relevant register description for details.

**RC** This means that the bit clears to 0 after a read.

**(SE)** This means that accesses to this register have indirect write side-effects. A side-effect occurs when a direct read or a direct write of a register creates an indirect write to the same register or to another register.

**WO** This means that the register or field is write-only.

**WI** This means that the register or field ignores writes.

**IMP DEF** This means that the access permissions are IMPLEMENTATION DEFINED.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See *Register access permissions for memory-mapped accesses* on page H8-4950.

a. Only if the Sample-based profiling Extension is implemented.
b. Some control bits are in the Core power domain. These bits ignore writes when Core power domain registers cannot be accessed as shown.
c. Some status bits are fetched from the Core power domain. These bits read UNKNOWN when Core power domain registers cannot be accessed as shown.
d. Implemented breakpoints and watchpoints only. *n* is the breakpoint or watchpoint number.

For the reset values for the external debug interface registers, see Table H8-6 on page H8-4963.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H8.7 Cross-trigger interface registers

The embedded Cross-trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the CTIDEVAFF0 or CTIDEVAFF1 registers it must be located 64KB above the debug registers in the external debug interface.

Table H8-4 shows the CTI register map.

**Table H8-4 Cross-trigger interface map**

| Offset | Mnemonic | Location of further details |
|---|---|---|
| 0x000 | CTICONTROL | *CTICONTROL, CTI Control register* on page H9-5069 |

## H8.8 External debug register resets

Each register or field has a defined reset domain:

- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.
- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.
- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

Table H8-6 and Table H8-7 on page H8-4964 show the external debug register and CTI register resets. For other debug registers and Performance Monitors registers, see *Management register resets* on page K2-5528 and *Power domains and Performance Monitors registers reset* on page I2-5114.

**Note**

By reference to Figure H6-2 on page H6-4935 the power domain can be deduced from the reset domain. Table K2-7 on page K2-5528 also shows reset power domains.

Table H8-6 and Table H8-7 on page H8-4964 do not include:

- Read-only identification registers, such as Processor ID Registers and PMCFGR, that have a fixed value from reset.
- Read-only status registers, such as EDSCR.RW, that are evaluated each time the register is read and that have no meaningful reset value.
- Write-only registers, such as EDRCR, that only have an effect on writes, and have no meaningful reset value.
- Read/write registers, such as breakpoint and watchpoint registers, and EDPRCR.CORENPDRQ, that alias other registers. The reset values are described by the descriptions of those other registers.
- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value, that can be UNKNOWN. The register is in the specified reset domain.

**Note**

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

**Table H8-6 Summary of external debug register resets, debug registers**

| Register | Reset domain | Field | Value | Description |
|---|---|---|---|---|
| EDESR | Warm | SS | EDECR.SS | Halting Step debug event pending |
| | | RC | EDECR.RCE | Reset Catch debug event pending |
| | | OSUC | 0 | OS Unlock Catch debug event pending |
| EDECR | External debug | SS | 0 | Halting Step debug event enable |
| | | RCE | 0 | Reset Catch debug event enable |
| | | OSUCE | 0 | OS Unlock Catch debug event enable |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table H8-6 Summary of external debug register resets, debug registers (continued)**

| Register | Reset domain | Field | Value | Description |
|---|---|---|---|---|
| EDWAR | Cold | - | - | All fields |
| EDSCR | Cold | RXfull | 0 | DTRRX register full |
| | | TXfull | 0 | DTRTX register full |
| | | RXO | 0 | DTRRX overrun |
| | | TXU | 0 | DTRTX underrun |
| | | INTdis | 0 | Interrupt disable |
| | | TDA | 0 | Trap debug register accesses to Debug state |
| | | MA | 0 | Memory access mode in Debug state |
| | | HDE | 0 | Halting debug mode enable |
| | | ERR | 0 | Cumulative error flag |
| EDECCR | Cold | NSE[2:1] | 0b00 | Coarse-grained Non-secure exception catch |
| | | SE[3,1] | 0b00 | Coarse-grained Secure exception catch |
| EDPCSR | Cold | - | - | All fields |
| EDCIDSR | Cold | - | - | All fields |
| EDVIDSR | Cold | - | - | All fields |
| EDPRCR | External debug | COREPURQ[a] | 0 | Core powerup request |
| EDPRSR | Warm | SDR | - | Sticky debug restart |
| | Cold | SPMAD | 0 | Sticky EPMAD error |
| | | SDAD | 0 | Sticky EDAD error |
| | Warm | SR | 1 | Sticky reset status |
| | Cold | SPD | 1 | Sticky powerdown status |

a. On a cold reset into AArch64 state, DBGPRCR_EL1.CORENPRDRQ resets to the value of EDPRCR.COREPURQ. On a cold reset into AArch32 state, DBGPRCR.CORENPRDRQ resets to the value of EDPRCR.COREPURQ.If an External Debug reset and a Cold reset coincide, both EDPRCR.COREPURQ and the CORENPRDRQ field of the appropriate System register are reset to 0.

Table H8-7 shows the reset values for the CTI registers

**Table H8-7 Summary of external debug register resets, CTI registers**

| Register | Reset domain | Field | Value | Description |
|---|---|---|---|---|
| CTICONTROL | External debug | GLBEN | 0 | CTI global enable |
| CTIAPPSET | External debug | - | - | All fields |
| CTIINEN<n> | External debug | - | - | All fields |
| CTIOUTEN<n> | External debug | - | - | All fields |
| CTIGATE | External debug | - | - | All fields |

# Chapter H9
# External Debug Register Descriptions

This chapter provides a description of the external debug registers.

It contains the following sections:

- *Introduction* on page H9-4966.
- *Debug registers* on page H9-4967.
- *Cross-Trigger Interface registers* on page H9-5054.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H9.1 Introduction

This section lists the registers that are accessible through the external debug interface.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## H9.2 Debug registers

This section lists the Debug registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.1 DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Usage constraints**

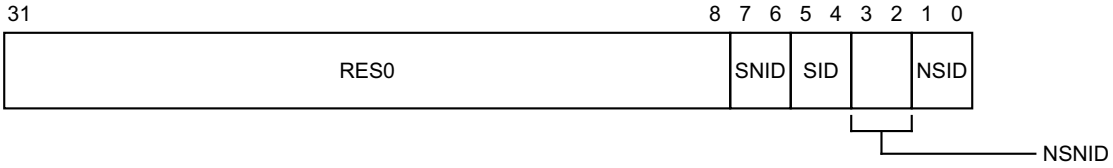
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

External register DBGAUTHSTATUS_EL1 is architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1.

External register DBGAUTHSTATUS_EL1 is architecturally mapped to AArch32 System register DBGAUTHSTATUS.



DBGAUTHSTATUS_EL1 is in the Debug power domain.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

## Field descriptions

The DBGAUTHSTATUS_EL1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Secure non-invasive debug. Possible values of this field are:

`00` Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.

`10` Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

`11` Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**SID, bits [5:4]**

Secure invasive debug. Possible values of this field are:

`00` Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.

`10` Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

`11` Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Other values are reserved.

**NSNID, bits [3:2]**

Non-secure non-invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.

10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.

10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

Other values are reserved.

### Accessing the DBGAUTHSTATUS_EL1:

DBGAUTHSTATUS_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFB8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | EDAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

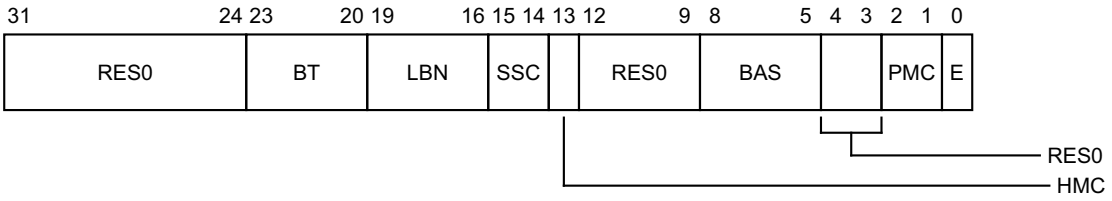
When the E field is zero, all the other fields in the register are ignored.

**Configurations**

External register DBGBCR<n>_EL1 is architecturally mapped to AArch64 System register DBGBCR<n>_EL1.

External register DBGBCR<n>_EL1 is architecturally mapped to AArch32 System register DBGBCR<n>.

DBGBCR<n>_EL1 is in the Core power domain.



If breakpoint n is not implemented then this register is unallocated.

**Attributes**

DBGBCR<n>_EL1 is a 32-bit register.

## Field descriptions

The DBGBCR<n>_EL1 bit assignments are:

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:

`0000` Unlinked instruction address match.

`0001` Linked instruction address match.

`0010` Unlinked context ID match.

`0011` Linked context ID match

`0100` Unlinked instruction address mismatch.

`0101` Linked instruction address mismatch.

`1000` Unlinked VMID match.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`1001` Linked VMID match.

`1010` Unlinked VMID and context ID match.

`1011` Linked VMID and context ID match.

The field breaks down as follows:

- BT[3:1]: Base type.

  `000` Match address. DBGBVR<n>_EL1 is the address of an instruction.

  `010` Mismatch address. Behaves as type `000` if in an AArch64 translation, or if Halting debug is enabled and halting is allowed. Otherwise, DBGBVR<n>_EL1 is the address of an instruction to be stepped.

  `001` Match context ID. DBGBVR<n>_EL1.ContextID is a context ID.

  `100` Match VMID. DBGBVR<n>_EL1.VMID is a VMID.

  `101` Match VMID and context ID. DBGBVR<n>_EL1.ContextID is a context ID, and DBGBVR<n>_EL1.VMID is a VMID.

- BT[0]: Enable linking.

Values `0b011x` and `0b11xx` are always reserved. Constraints on breakpoint programming mean other values are reserved under some conditions. For more information, including the effect of programming this field to a reserved value, see *Reserved DBGBCR<n>_EL1.BT values* on page D2-1663.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see *Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values* on page D2-1664.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1.SSC description.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1. Otherwise:

- BAS[2] and BAS[0] are read/write.
- BAS[3] and BAS[1] are read-only copies of BAS[2] and BAS[0] respectively.

The values `0011` and `1100` are only supported if AArch32 is supported at any Exception level.

The permitted values depend on the breakpoint type.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

| BAS | Match instruction at | Constraint for debuggers |
|---|---|---|
| 0011 | DBGBVR<n>_EL1 | Use for T32 instructions. |
| 1100 | DBGBVR<n>_EL1+2 | Use for T32 instructions. |
| 1111 | DBGBVR<n>_EL1 | Use for A64 and A32 instructions. |

0000 is reserved and must behave as if the breakpoint is disabled or map to a permitted value.

For more information, see *Using the BAS field in Address Match breakpoints* on page G2-3909.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

| BAS | Step instruction at | Constraint for debuggers |
|---|---|---|
| 0000 | - | Use for a match anywhere breakpoint. |
| 0011 | DBGBVR<n>_EL1 | Use for stepping T32 instructions. |
| 1100 | DBGBVR<n>_EL1+2 | Use for stepping T32 instructions. |
| 1111 | DBGBVR<n>_EL1 | Use for stepping A64 and A32 instructions. |

For more information, see *Using the BAS field in Address Match breakpoints* on page G2-3909.

For Context matching breakpoints, this field is RES1 and ignored.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

**E, bit [0]**

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

0 Breakpoint disabled.

1 Breakpoint enabled.

## Accessing the DBGBCR<n>_EL1:

DBGBCR<n>_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x408 + 16n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | EDAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

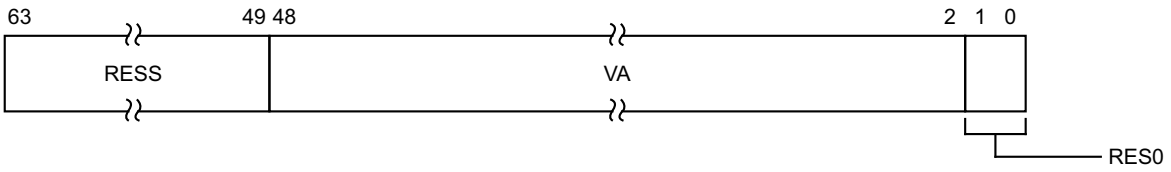
External register DBGBVR<n>_EL1 is architecturally mapped to AArch64 System register DBGBVR<n>_EL1.

External register DBGBVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGBVR<n>.

External register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register DBGBXVR<n>.

DBGBVR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then this register is unallocated.



**Attributes**

DBGBVR<n>_EL1 is a 64-bit register.

## Field descriptions

The DBGBVR<n>_EL1 bit assignments are:

***When DBGBCR<n>_EL1.BT==0b0x0x:***

**RESS, bits [63:49]**

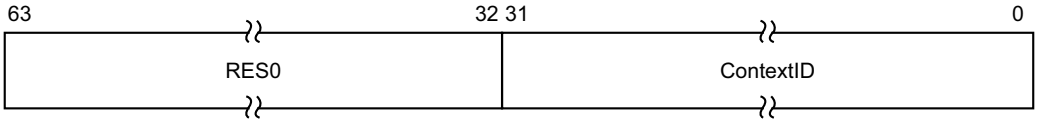
Reserved, Sign extended. Hardware and software must treat this field as RES0 if bit[48] is 0 or RES0, and as RES1 if bit[48] is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of bit [48], meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA, bits [48:2]**

If the address is being matched in an AArch64 stage 1 translation regime, this field contains bits[48:2] of the address for comparison.



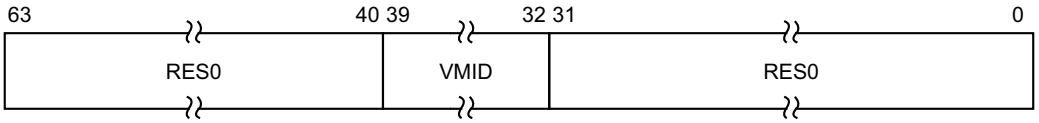
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If the address is being matched in an AArch32 stage 1 translation regime, the first 16 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

**Bits [1:0]**

Reserved, RES0.

***When DBGBCR<n>_EL1.BT==0b0x1x:***



**Bits [63:32]**

Reserved, RES0.

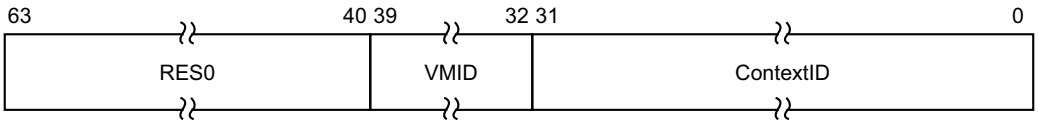
**ContextID, bits [31:0]**

Context ID value for comparison.

***When DBGBCR<n>_EL1.BT==0b1x0x and EL2 implemented:***

**Bits [63:40]**

Reserved, RES0.



**VMID, bits [39:32]**

VMID value for comparison.

**Bits [31:0]**

Reserved, RES0.

***When DBGBCR<n>_EL1.BT==0x1x1x and EL2 implemented:***

**Bits [63:40]**

Reserved, RES0.

**VMID, bits [39:32]**

VMID value for comparison.

**ContextID, bits [31:0]**

Context ID value for comparison.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the DBGBVR<n>_EL1:

DBGBVR<n>_EL1[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x400` + 16n |

DBGBVR<n>_EL1[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x404` + 16n |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.2.4 DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RW |

The architecture does not define any functionality for the CLAIM tag bits.

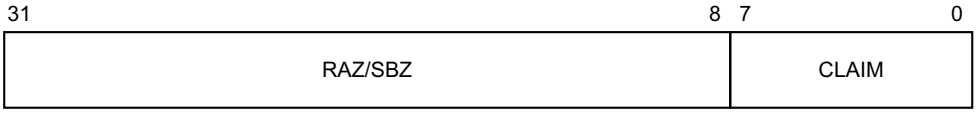
Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configurations**

External register DBGCLAIMCLR_EL1 is architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1.

External register DBGCLAIMCLR_EL1 is architecturally mapped to AArch32 System register DBGCLAIMCLR.

DBGCLAIMCLR_EL1 is in the Core power domain.



An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMCLR_EL1 is a 32-bit register.

#### Field descriptions

The DBGCLAIMCLR_EL1 bit assignments are:

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the DBGCLAIMCLR_EL1:

DBGCLAIMCLR_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFA4 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.5 DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RW |

The architecture does not define any functionality for the CLAIM tag bits.

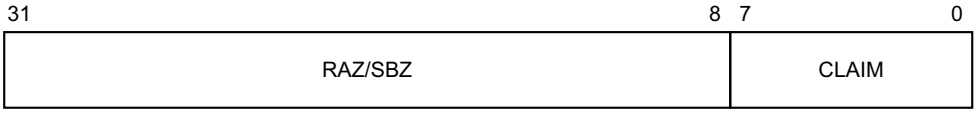
Used in conjunction with the DBGCLAIMCLR_EL1 register.

**Configurations**

External register DBGCLAIMSET_EL1 is architecturally mapped to AArch64 System register DBGCLAIMSET_EL1.

External register DBGCLAIMSET_EL1 is architecturally mapped to AArch32 System register DBGCLAIMSET.

DBGCLAIMSET_EL1 is in the Core power domain.



An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 32-bit register.

## Field descriptions

The DBGCLAIMSET_EL1 bit assignments are:

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

Non-Confidential - Beta

### Accessing the DBGCLAIMSET_EL1:

DBGCLAIMSET_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFA0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.6 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RW |

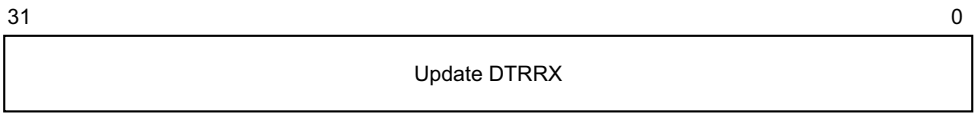
If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

**Configurations**

External register DBGDTRRX_EL0 is architecturally mapped to AArch64 System register DBGDTRRX_EL0.

External register DBGDTRRX_EL0 is architecturally mapped to AArch32 System register DBGDTRRXint.



DBGDTRRX_EL0 is in the Core power domain.

**Attributes**

DBGDTRRX_EL0 is a 32-bit register.

## Field descriptions

The DBGDTRRX_EL0 bit assignments are:

**Bits [31:0]**

Update DTRRX.

If RXfull is set to 0, then writes to this register update the value in DTRRX and set RXfull to 1.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the DBGDTRRX_EL0:

DBGDTRRX_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x080 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.7 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RW |

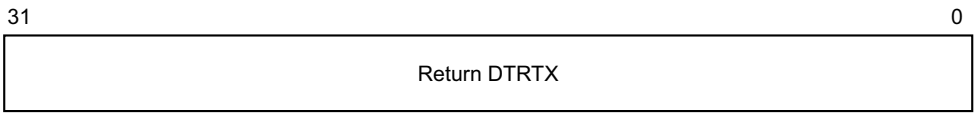
If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

**Configurations**

External register DBGDTRTX_EL0 is architecturally mapped to AArch64 System register DBGDTRTX_EL0.

External register DBGDTRTX_EL0 is architecturally mapped to AArch32 System register DBGDTRTXint.



DBGDTRTX_EL0 is in the Core power domain.

**Attributes**

DBGDTRTX_EL0 is a 32-bit register.

## Field descriptions

The DBGDTRTX_EL0 bit assignments are:

**Bits [31:0]**

Return DTRTX.

If TXfull is set to 1, then reads of this register return the value in DTRTX and clear TXfull to 0.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the DBGDTRTX_EL0:

DBGDTRTX_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x08C |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.2.8 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | EDAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

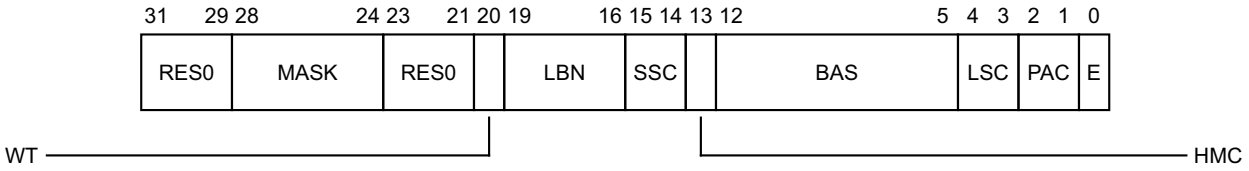
When the E field is zero, all the other fields in the register are ignored.

**Configurations**

External register DBGWCR<n>_EL1 is architecturally mapped to AArch64 System register DBGWCR<n>_EL1.

External register DBGWCR<n>_EL1 is architecturally mapped to AArch32 System register DBGWCR<n>.

DBGWCR<n>_EL1 is in the Core power domain.



If breakpoint n is not implemented then this register is unallocated.

**Attributes**

DBGWCR<n>_EL1 is a 32-bit register.

## Field descriptions

The DBGWCR<n>_EL1 bit assignments are:

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

`00000` No mask.

`00001` Reserved.

`00010` Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

0 Unlinked data address match.

1 Linked data address match.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

| BAS | Description |
|---|---|
| xxxxxxx1 | Match byte at DBGWVR<n>_EL1 |
| xxxxxx1x | Match byte at DBGWVR<n>_EL1+1 |
| xxxxx1xx | Match byte at DBGWVR<n>_EL1+2 |
| xxxx1xxx | Match byte at DBGWVR<n>_EL1+3 |

In cases where DBGWVR<n>_EL1 addresses a double-word:

| BAS | Description, if DBGWVR<n>_EL1[2] == 0 |
|---|---|
| xxx1xxxx | Match byte at DBGWVR<n>_EL1+4 |
| xx1xxxxx | Match byte at DBGWVR<n>_EL1+5 |
| x1xxxxxx | Match byte at DBGWVR<n>_EL1+6 |
| 1xxxxxxx | Match byte at DBGWVR<n>_EL1+7 |

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] is used. ARM deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are 0b00000000, or a binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software.

If BAS is zero, no bytes are watched by this watchpoint.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

`01` Match instructions that load from a watchpointed address.

`10` Match instructions that store to a watchpointed address.

`11` Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

**E, bit [0]**

Enable watchpoint n. Possible values are:

`0` Watchpoint disabled.

`1` Watchpoint enabled.

### Accessing the DBGWCR<n>_EL1:

DBGWCR<n>_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x808` + 16n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.9 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

**Usage constraints**

This register is accessible as follows:

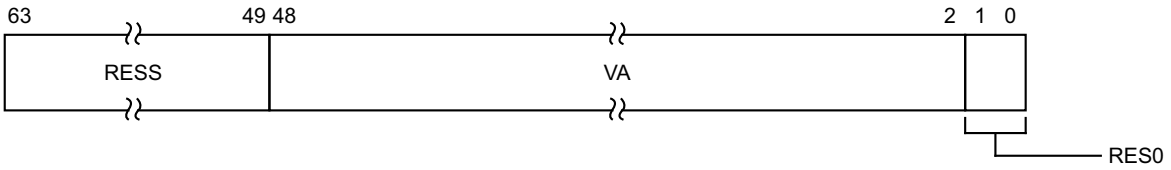
| Off | DLK | OSLK | EDAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register DBGWVR<n>_EL1 is architecturally mapped to AArch64 System register DBGWVR<n>_EL1.

External register DBGWVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWVR<n>.

DBGWVR<n>_EL1 is in the Core power domain.



If breakpoint n is not implemented then this register is unallocated.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

## Field descriptions

The DBGWVR<n>_EL1 bit assignments are:

**RESS, bits [63:49]**

Reserved, Sign extended. Hardware and software must treat this field as RES0 if bit[48] is 0 or RES0, and as RES1 if bit[48] is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of bit [48], meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA, bits [48:2]**

Bits[48:2] of the address value for comparison.

ARM deprecates setting DBGWVR<n>_EL1[2] == 1.

**Bits [1:0]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the DBGWVR<n>_EL1:

DBGWVR<n>_EL1[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x800 + 16n |

DBGWVR<n>_EL1[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x804 + 16n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.10 EDAA32PFR, External Debug AArch32 Processor Feature Register

The EDAA32PFR characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch32.

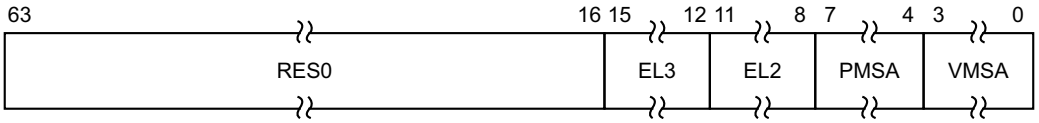
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDAA32PFR is in the Debug power domain.



EDAA32PFR is only accessible in an AArch32-only implementation. If AArch64 is supported at any Exception level, EDAA32PFR is RES0.

**Attributes**

EDAA32PFR is a 64-bit register.

## Field descriptions

The EDAA32PFR bit assignments are:

**Bits [63:16]**

Reserved, RES0.

**EL3, bits [15:12]**

AArch32 EL3 Exception level handling. Only valid if EDPFR.EL3 is `0000`. Defined values are:

`0000` EL3 is not implemented.

`0001` EL3 can be executed in AArch32 state only.

All other values are reserved.

**Note**

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

**EL2, bits [11:8]**

AArch32 EL2 Exception level handling. Only valid if EDPFR.EL2 is `0000`. Defined values are:

`0000` EL2 is not implemented.

`0001` EL2 can be executed in AArch32 state only.

All other values are reserved.

**Note**

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PMSA, bits [7:4]**

Indicates support for an ARMv8-R PMSA. Defined values are:

`0000` PMSA not supported.

`0100` Support for an ARMv8-R PMSAv8.

All other values are reserved. In ARMv8-A, the only permitted value is `0000`.

**VMSA, bits [3:0]**

Indicates support for an ARMv8-R VMSA. Defined values are:

`0000` VMSA not supported.

`0101` Support for an ARMv8-R VMSAv8-32.

All other values are reserved. In ARMv8-A, the only permitted value is `0000`.

### Accessing the EDAA32PFR:

EDAA32PFR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xD60` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

**Purpose**

Allows implementations to support IMPLEMENTATION DEFINED controls.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| IMP DEF | IMP DEF | IMP DEF | RO | RW |

**Configurations**

It is IMPLEMENTATION DEFINED whether EDACR is in the Core power domain or in the Debug power domain.

**Attributes**

EDACR is a 32-bit register.

#### Field descriptions

The EDACR bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

#### Accessing the EDACR:

EDACR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x094 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

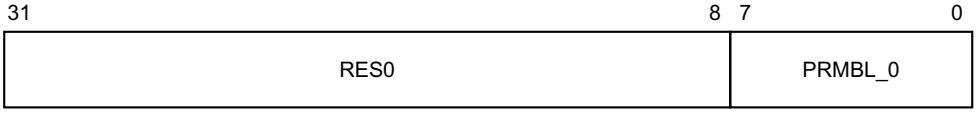
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDCIDR0 is in the Debug power domain.

EDCIDR0 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDCIDR0 is a 32-bit register.

#### Field descriptions

The EDCIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as `0x0D`.

#### Accessing the EDCIDR0:

EDCIDR0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFF0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

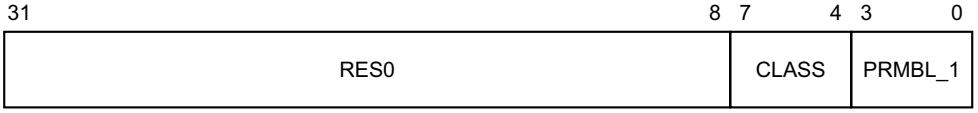
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDCIDR1 is in the Debug power domain.

EDCIDR1 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDCIDR1 is a 32-bit register.

#### Field descriptions

The EDCIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as `0x9`, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

#### Accessing the EDCIDR1:

EDCIDR1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFF4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.14 EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

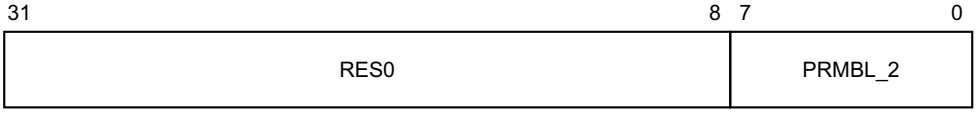
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDCIDR2 is in the Debug power domain.

EDCIDR2 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDCIDR2 is a 32-bit register.

#### Field descriptions

The EDCIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as `0x05`.

#### Accessing the EDCIDR2:

EDCIDR2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFF8` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.15 EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

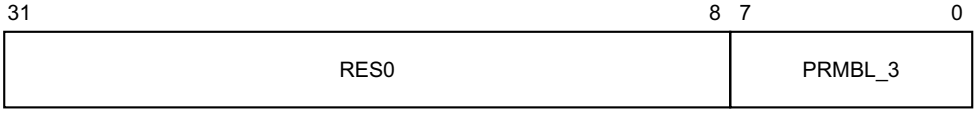
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDCIDR3 is in the Debug power domain.

EDCIDR3 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDCIDR3 is a 32-bit register.

#### Field descriptions

The EDCIDR3 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as `0xB1`.

#### Accessing the EDCIDR3:

EDCIDR3 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFFC` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.16 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

**Purpose**

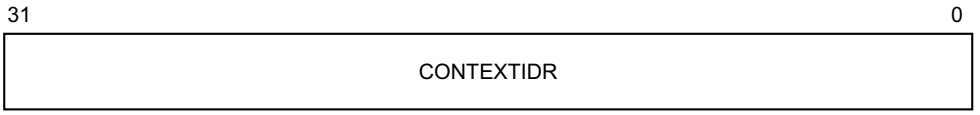
Contains the sampled value of CONTEXTIDR_EL1, captured on reading the low half of EDPCSR.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | Default |
|---|---|---|---|
| Error | Error | Error | RO |

**Configurations**



EDCIDSR is in the Core power domain.

**Attributes**

EDCIDSR is a 32-bit register.

#### Field descriptions

The EDCIDSR bit assignments are:

**CONTEXTIDR, bits [31:0]**

The sampled value of CONTEXTIDR_EL1, captured on reading the low half of EDPCSR.

If EL3 is implemented and using AArch32 then CONTEXTIDR is a Banked register, and EDCIDSR samples the current Banked copy of CONTEXTIDR.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

#### Accessing the EDCIDSR:

EDCIDSR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x0A4 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.17 EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

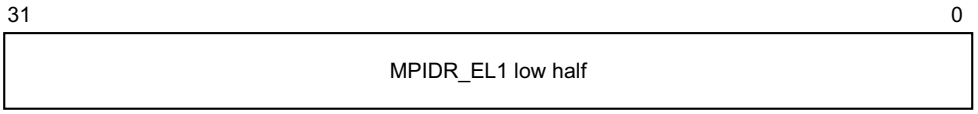
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDDEVAFF0 is in the Debug power domain.



EDDEVAFF0 is optional to implement in the external register interface.

**Attributes**

EDDEVAFF0 is a 32-bit register.

#### Field descriptions

The EDDEVAFF0 bit assignments are:

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

#### Accessing the EDDEVAFF0:

EDDEVAFF0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFA8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.18 EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

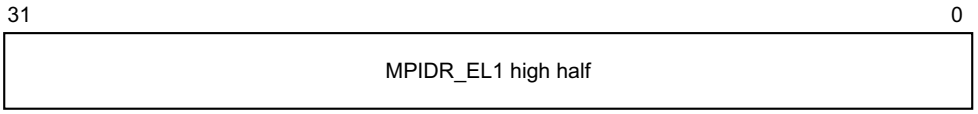
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDDEVAFF1 is in the Debug power domain.



EDDEVAFF1 is optional to implement in the external register interface.

**Attributes**

EDDEVAFF1 is a 32-bit register.

#### Field descriptions

The EDDEVAFF1 bit assignments are:

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

#### Accessing the EDDEVAFF1:

EDDEVAFF1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFAC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.19 EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the external debug component.

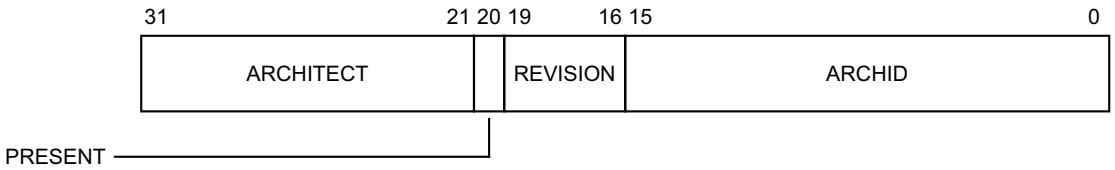
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDDEVARCH is in the Debug power domain.



EDDEVARCH is optional to implement in the external register interface.

**Attributes**

EDDEVARCH is a 32-bit register.

## Field descriptions

The EDDEVARCH bit assignments are:

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For debug, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, `0x4`.

Bits [27:21] are the JEP 106 ID code, `0x3B`.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For debug, the revision defined by ARMv8 is `0x0`.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For debug:

- Bits [15:12] are the architecture version, `0x6`.
- Bits [11:0] are the architecture part number, `0xA15`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This corresponds to the ARMv8 debug architecture version.

### Accessing the EDDEVARCH:

EDDEVARCH can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFBC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

**Purpose**

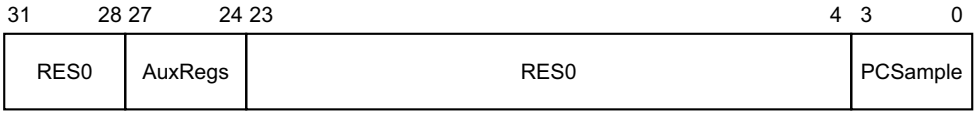
Provides extra information for external debuggers about features of the debug implementation.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**



EDDEVID is in the Debug power domain.

**Attributes**

EDDEVID is a 32-bit register.

### Field descriptions

The EDDEVID bit assignments are:

**Bits [31:28]**

Reserved, RES0.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

`0000` None supported.

`0001` Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

**Bits [23:4]**

Reserved, RES0.

**PCSample, bits [3:0]**

Indicates the level of Sample-based profiling support using external debug registers 40 through 43. Permitted values of this field in ARMv8 are:

`0000` Architecture-defined form of Sample-based profiling not implemented.

`0010` EDPCSR and EDCIDSR are implemented (only permitted if EL3 and EL2 are not implemented).

`0011` EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the EDDEVID:

EDDEVID can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFC8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.21 EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

**Purpose**

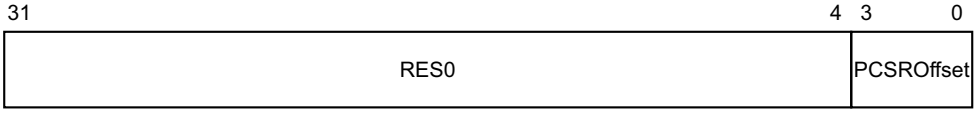
Provides extra information for external debuggers about features of the debug implementation.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**



EDDEVID1 is in the Debug power domain.

**Attributes**

EDDEVID1 is a 32-bit register.

#### Field descriptions

The EDDEVID1 bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in ARMv8 are:

`0000` EDPCSR not implemented.

`0010` EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

#### Accessing the EDDEVID1:

EDDEVID1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFC4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.22 EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

**Purpose**

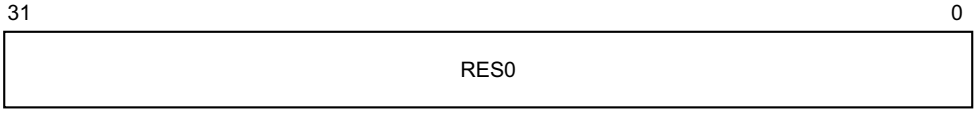
Reserved for future descriptions of features of the debug implementation.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**



EDDEVID2 is in the Debug power domain.

**Attributes**

EDDEVID2 is a 32-bit register.

#### Field descriptions

The EDDEVID2 bit assignments are:

**Bits [31:0]**

Reserved, RES0.

#### Accessing the EDDEVID2:

EDDEVID2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFC0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.23 EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs debug logic.

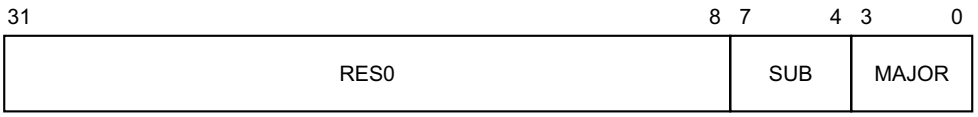
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDDEVTYPE is in the Debug power domain.



EDDEVTYPE is optional to implement in the external register interface.

**Attributes**

EDDEVTYPE is a 32-bit register.

#### Field descriptions

The EDDEVTYPE bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as `0x1` to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as `0x5` to indicate this is a debug logic component.

#### Accessing the EDDEVTYPE:

EDDEVTYPE can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFCC` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.24 EDDFR, External Debug Feature Register

The EDDFR characteristics are:

**Purpose**

Provides top level information about the debug system in AArch64.

**Usage constraints**

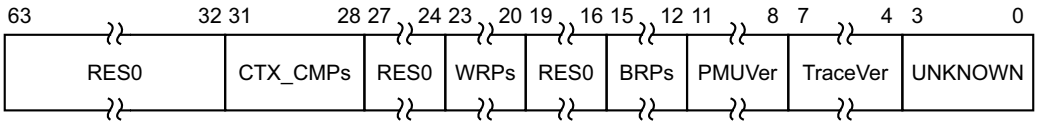
This register is accessible as follows:

| Default |
|---|
| RO |

Debuggers must use EDDEVARCH to determine the Debug architecture version.

**Configurations**

External register EDDFR is architecturally mapped to AArch64 System register ID_AA64DFR0_EL1.



EDDFR is in the Debug power domain.

**Attributes**

EDDFR is a 64-bit register.

#### Field descriptions

The EDDFR bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of `0b0000` is reserved.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of `0b0000` is reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**PMUVer, bits [11:8]**

Performance Monitors extension version. Indicates whether System register interface to Performance Monitors extension is implemented. Defined values are:

`0000` Performance Monitors extension System registers not implemented.

`0001` Performance Monitors extension System registers implemented, PMUv3.

`1111` IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported.

All other values are reserved.

**TraceVer, bits [7:4]**

Trace support. Indicates whether System register interface to a trace macrocell is implemented. Defined values are:

`0000` Trace macrocell System registers not implemented.

`0001` Trace macrocell System registers implemented.

All other values are reserved.

A value of `0000` only indicates that no System register interface to a trace macrocell is implemented. A trace macrocell might nevertheless be implemented without a System register interface.

**UNKNOWN, bits [3:0]**

Reserved, UNKNOWN.

### Accessing the EDDFR:

EDDFR[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xD28` |

EDDFR[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xD2C` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.25 EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

**Purpose**

Controls exception catch debug events.

**Usage constraints**

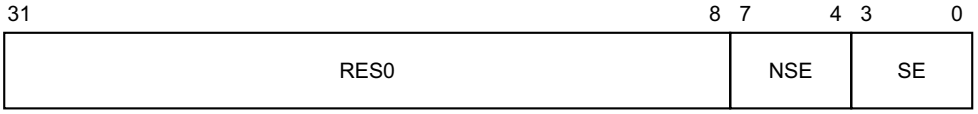
This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RW |

**Configurations**

External register EDECCR is architecturally mapped to AArch64 System register OSECCR_EL1.

External register EDECCR is architecturally mapped to AArch32 System register DBGOSECCR.



EDECCR is in the Core power domain.

**Attributes**

EDECCR is a 32-bit register.

## Field descriptions

The EDECCR bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**NSE, bits [7:4]**

Coarse-grained Non-secure exception catch. Possible values of this field are:

`0000` Exception catch debug event disabled for Non-secure Exception levels.

`0010` Exception catch debug event enabled for Non-secure EL1.

`0100` Exception catch debug event enabled for Non-secure EL2.

`0110` Exception catch debug event enabled for Non-secure EL1 and EL2.

All other values are reserved. Bits [7,4] are reserved, RES0.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

**SE, bits [3:0]**

Coarse-grained Secure exception catch. Possible values of this field are:

`0000` Exception catch debug event disabled for Secure Exception levels.

`0010` Exception catch debug event enabled for Secure EL1.

`1000` Exception catch debug event enabled for Secure EL3.

`1010` Exception catch debug event enabled for Secure EL1 and EL3.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

All other values are reserved. Bits [2,0] are reserved. RES0. Ignored if ExternalSecureInvasiveDebugEnabled() == FALSE.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

### Accessing the EDECCR:

EDECCR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x098` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.2.26 EDECR, External Debug Execution Control Register

The EDECR characteristics are:

**Purpose**

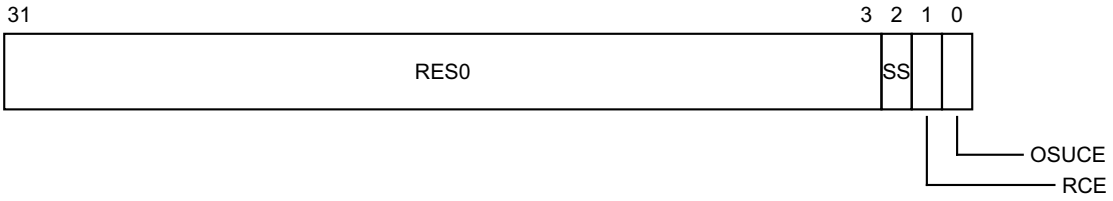
Controls Halting debug events.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



EDECR is in the Debug power domain.

**Attributes**

EDECR is a 32-bit register.

#### Field descriptions

The EDECR bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

Halting step enable. Possible values of this field are:

`0` Halting step debug event disabled.

`1` Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, the resulting value of EDECR.SS is UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on External debug reset.

**RCE, bit [1]**

Reset catch enable. Possible values of this field are:

`0` Reset catch debug event disabled.

`1` Reset catch debug event enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on External debug reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**OSUCE, bit [0]**

OS unlock catch enabled. Possible values of this field are:

`0` OS unlock catch debug event disabled.

`1` OS unlock catch debug event enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on External debug reset.

### Accessing the EDECR:

EDECR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x024` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.2.27 EDESR, External Debug Event Status Register

The EDESR characteristics are:

**Purpose**

Indicates the status of internally pending Halting debug events.

**Usage constraints**

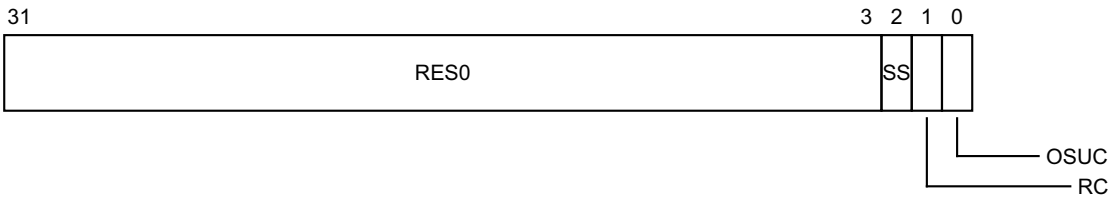
This register is accessible as follows:

| Off | DLK | SLK | Default |
|---|---|---|---|
| Error | Error | RO | RW |

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONSTRAINED UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it may become pending again when the Core is powered back on and Cold reset.

**Configurations**



EDESR is in the Core power domain.

**Attributes**

EDESR is a 32-bit register.

## Field descriptions

The EDESR bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

Halting step debug event pending. Possible values of this field are:

`0` Reading this means that a Halting step debug event is not pending. Writing this means no action.

`1` Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

When this register has an architecturally-defined reset value, this field resets to the value of EDECR.SS.

This field resets to its defined reset value on Warm reset.

**RC, bit [1]**

Reset catch debug event pending. Possible values of this field are:

`0` Reading this means that a Reset catch debug event is not pending. Writing this means no action.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`1` Reading this means that a Reset catch debug event is pending. Writing this clears the pending Reset catch debug event.

When this register has an architecturally-defined reset value, this field resets to the value of EDECR.RCE.

This field resets to its defined reset value on Warm reset.

**OSUC, bit [0]**

OS unlock debug event pending. Possible values of this field are:

`0` Reading this means that an OS unlock catch debug event is not pending. Writing this means no action.

`1` Reading this means that an OS unlock catch debug event is pending. Writing this clears the pending OS unlock catch debug event.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

### Accessing the EDESR:

EDESR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x020` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.28 EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

**Purpose**

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

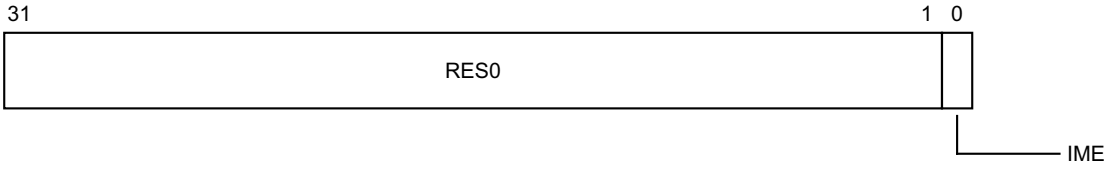
**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | Default |
|---|---|---|---|
| IMP DEF | IMP DEF | IMP DEF | RW |

**Configurations**

It is IMPLEMENTATION DEFINED whether EDITCTRL is in the Core power domain or in the Debug power domain.



EDITCTRL is optional to implement in the external register interface.

**Attributes**

EDITCTRL is a 32-bit register.

## Field descriptions

The EDITCTRL bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

`0` Normal operation.

`1` Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the EDITCTRL:

EDITCTRL can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xF00` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.2.29 EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

**Purpose**

Used in Debug state for passing instructions to the PE for execution.

**Usage constraints**

This register is accessible as follows:

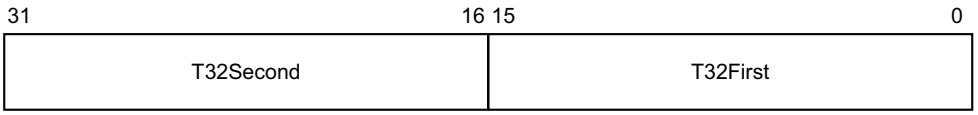
| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | WI | WO |

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

**Configurations**

EDITR is in the Core power domain.



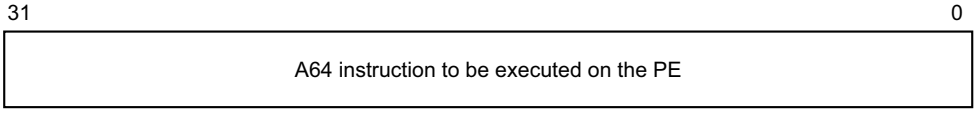
**Attributes**

EDITR is a 32-bit register.

#### Field descriptions

The EDITR bit assignments are:

***When in AArch32 state:***



**T32Second, bits [31:16]**

Second halfword of the T32 instruction to be executed on the PE.

**T32First, bits [15:0]**

First halfword of the T32 instruction to be executed on the PE.

***When in AArch64 state:***

**Bits [31:0]**

A64 instruction to be executed on the PE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the EDITR:

EDITR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x084 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.2.30 EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

**Purpose**

Allows or disallows access to the external debug registers through a memory-mapped interface.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| WO |

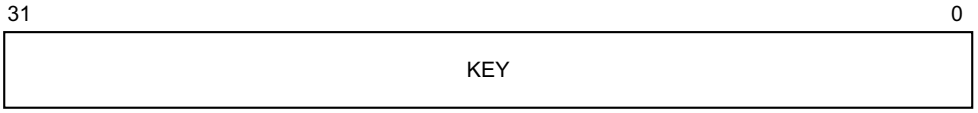
**Configurations**

EDLAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

EDLAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.



Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLAR is a 32-bit register.

#### Field descriptions

The EDLAR bit assignments are:

**KEY, bits [31:0]**

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

#### Accessing the EDLAR:

EDLAR can be accessed through the memory-mapped interface:

| Component | Offset |
|---|---|
| Debug | `0xFB0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.2.31 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for external debug registers.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

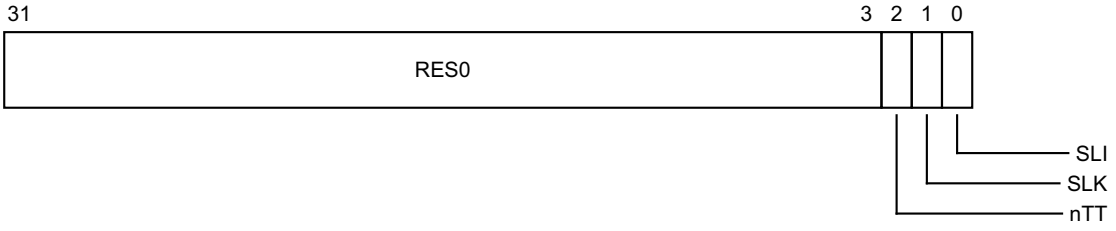
**Configurations**

EDLSR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

EDLSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.



Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLSR is a 32-bit register.

### Field descriptions

The EDLSR bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

`0` Lock clear. Writes are permitted to this component's registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on External debug reset.

**SLI, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

0 Software lock not implemented or not memory-mapped access.

1 Software lock implemented and memory-mapped access.

### Accessing the EDLSR:

EDLSR can be accessed through the memory-mapped interface:

| Component | Offset |
|---|---|
| Debug | 0xFB4 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.2.32 EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

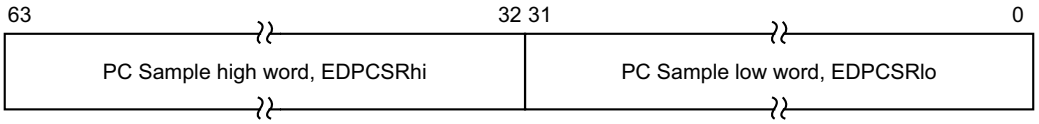
**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RO |

**Configurations**

EDPCSR is in the Core power domain.



EDPCSR is optional to implement in the external register interface.

**Attributes**

EDPCSR is a 64-bit register.

### Field descriptions

The EDPCSR bit assignments are:

**Bits [63:32]**

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled PC.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [31:0]**

PC Sample low word, EDPCSRlo. Bits [31:0] of the sampled instruction address value. Reading EDPCSRlo has the side-effect of updating EDCIDSR, EDVIDSR, and EDPCSRhi. However:

- If the PE is in Debug state, or Sample-based profiling is prohibited, EDPCSRlo reads as `0xFFFFFFFF` and EDCIDSR, EDVIDSR, and EDPCSRhi become UNKNOWN.
- If the PE is in Reset state, the sampled value is unknown and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN.
- If no instruction has been retired since the PE left Reset state, Debug state, or a state where Non-invasive debug is not permitted, the sampled value is UNKNOWN and EDCIDSR, EDVIDSR, and EDPCSRhi become UNKNOWN.
- For a read of EDPCSRlo from the memory-mapped interface, if EDLSR.SLK == 1, meaning the Software Lock is locked, then the access has no side-effects. That is, EDCIDSR, EDVIDSR, and EDPCSRhi are unchanged.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the EDPCSR:

EDPCSR[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x0A0 |

EDPCSR[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x0AC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.33 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64.

**Usage constraints**

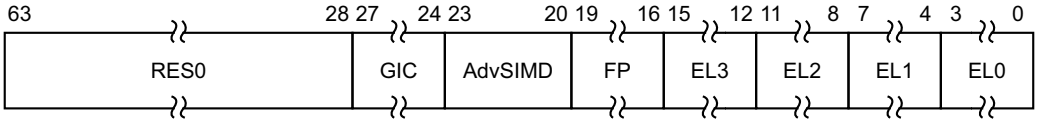
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

External register EDPFR is architecturally mapped to AArch64 System register ID_AA64PFR0_EL1.

EDPFR is in the Debug power domain.



If AArch64 is supported at any Exception level, bits [27:0] take the value of the System register ID_AA64PFR0_EL1[27:0]. Otherwise, bits [27:16] have the same definition as ID_AA64PFR0_EL1, even though AArch64 is not implemented, and bits [15:0] are zero.

**Attributes**

EDPFR is a 64-bit register.

## Field descriptions

The EDPFR bit assignments are:

**Bits [63:28]**

Reserved, RES0.

**GIC, bits [27:24]**

System register GIC interface support. Defined values are:

0000 No System register interface to the GIC is supported.

0001 System register interface to the GIC CPU interface is supported.

All other values are reserved.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

0000 Advanced SIMD is implemented.

1111 Advanced SIMD is not implemented.

All other values are reserved.

**FP, bits [19:16]**

Floating-point. Defined values are:

0000 Floating-point is implemented.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1111 Floating-point is not implemented.

All other values are reserved.

**EL3, bits [15:12]**

AArch64 EL3 Exception level handling. Defined values are:

0000 EL3 is not implemented or cannot be executed in AArch64 state.

0001 EL3 can be executed in AArch64 state only.

0010 EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

**EL2, bits [11:8]**

AArch64 EL2 Exception level handling. Defined values are:

0000 EL2 is not implemented or cannot be executed in AArch64 state.

0001 EL2 can be executed in AArch64 state only.

0010 EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

**EL1, bits [7:4]**

AArch64 EL1 Exception level handling. Defined values are:

0000 EL1 can be executed in AArch32 state only.

0001 EL1 can be executed in AArch64 state only.

0010 EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

**EL0, bits [3:0]**

AArch64 EL0 Exception level handling. Defined values are:

0000 EL0 can be executed in AArch32 state only.

0001 EL0 can be executed in AArch64 state only.

0010 EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### Accessing the EDPFR:

EDPFR[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xD20 |

EDPFR[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xD24 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.34 EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

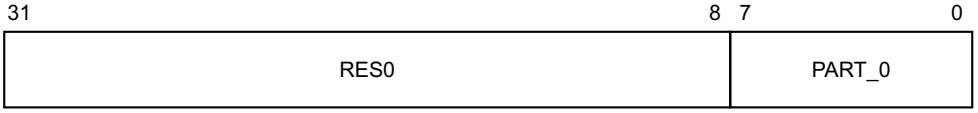
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDPIDR0 is in the Debug power domain.

EDPIDR0 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

#### Field descriptions

The EDPIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

#### Accessing the EDPIDR0:

EDPIDR0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFE0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.35 EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

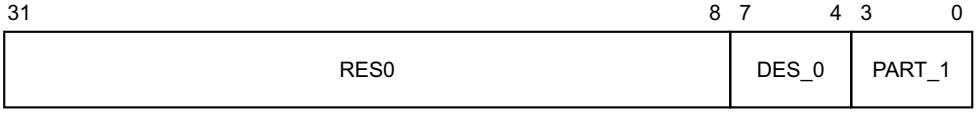
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDPIDR1 is in the Debug power domain.

EDPIDR1 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

#### Field descriptions

The EDPIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is `0b1011`.

**PART_1, bits [3:0]**

Part number, most significant nibble.

#### Accessing the EDPIDR1:

EDPIDR1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFE4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.36 EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

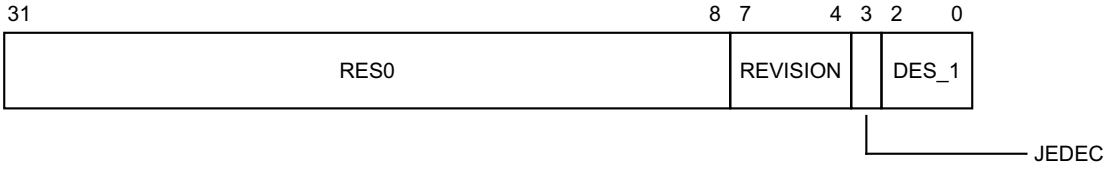
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDPIDR2 is in the Debug power domain.

EDPIDR2 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDPIDR2 is a 32-bit register.

#### Field descriptions

The EDPIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is `0b011`.

#### Accessing the EDPIDR2:

EDPIDR2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFE8` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.37 EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

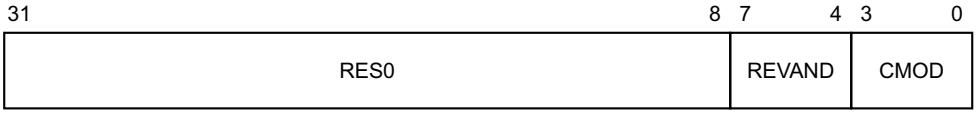
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDPIDR3 is in the Debug power domain.

EDPIDR3 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDPIDR3 is a 32-bit register.

#### Field descriptions

The EDPIDR3 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

#### Accessing the EDPIDR3:

EDPIDR3 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xFEC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.38 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

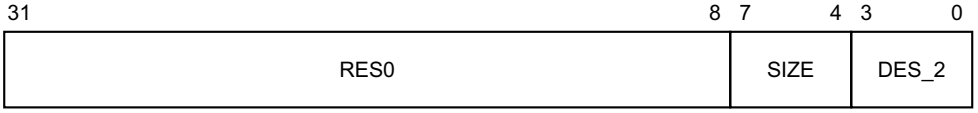
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

EDPIDR4 is in the Debug power domain.

EDPIDR4 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

#### Field descriptions

The EDPIDR4 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. $Log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is `0b0100`.

#### Accessing the EDPIDR4:

EDPIDR4 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0xFD0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.39 EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

**Purpose**

Controls the PE functionality related to powerup, reset, and powerdown.

**Usage constraints**

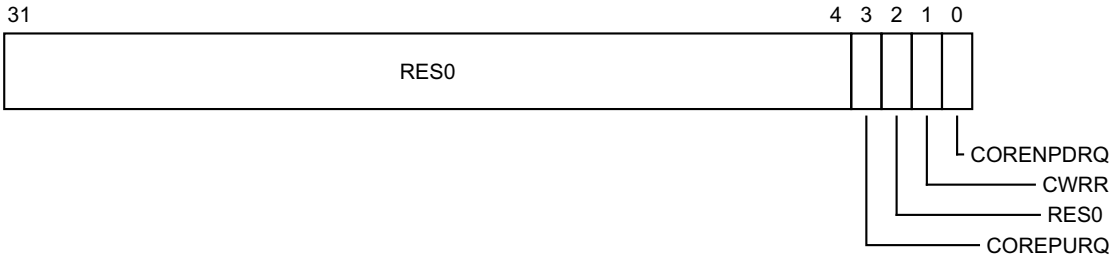
Accessing this register depends on which field is being accessed; see the register field descriptions for the states that they are accessible in.

**Configurations**

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Bit [0] of this register is mapped to DBGPRCR.CORENPDRQ, bit [0] of the AArch32 view of this register.

Bit [0] of this register is mapped to DBGPRCR_EL1.CORENPDRQ, bit [0] of the AArch64 view of this register.



The other bits in these registers are not mapped to each other.

**Attributes**

EDPRCR is a 32-bit register.

#### Field descriptions

The EDPRCR bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**COREPURQ, bit [3]**

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain. The actions on writing to this bit are:

`0` Do not request power up of the Core power domain.

`1` Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This bit can be read and written when the Core power domain is powered off.

The power controller must not allow the Core power domain to switch off while this bit is one.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on External debug reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field is accessible as shown below:

| SLK | Default |
|---|---|
| RO | RW |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**Bit [2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request. Write only bit that reads as zero. The actions on writing to this bit are:

`0` No action.

`1` Request Warm reset.

The PE ignores writes to this bit if any of the following are the case:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and one of the following is true:
  - EL3 is implemented.
  - The implemented Security state is Secure state.
- The Core power domain is either completely off or in a low-power state where the Core power domain registers cannot be accessed.
- DoubleLockStatus() == TRUE (OS Double Lock is set).
- OSLSR.OSLK == 1 (OS lock is locked).

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

When a write to this bit initiates a Warm Reset, the extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

**Note**

Although the ARM architecture permits the first option from the above list, ARM recommends that either of the other options is implemented.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| WI | WI | WI | WI | WO |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CORENPDRQ, bit [0]**

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

`0` On a powerdown request, the system powers down the Core power domain.

`1` On a powerdown request, the system emulates powerdown of the Core power domain. In this emulation mode the Core power domain is not actually powered down.

This bit is UNKNOWN, and the PE ignores writes to this bit if any of the following are the case:

- The Core power domain is either completely off or in a low-power state where the Core power domain registers cannot be accessed.
- DoubleLockStatus() == TRUE (OS Double Lock is set).
- OSLSR.OSLK == 1 (OS lock is locked).

When this register has an architecturally-defined reset value, this field resets to the value of EDPRCR.COREPURQ.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| WI | WI | WI | RO | RW |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

## Accessing the EDPRCR:

EDPRCR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x310` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.2.40 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

**Purpose**

Holds information about the reset and powerdown state of the PE.

**Usage constraints**

Accessing this register depends on which field is being accessed; see the register field descriptions for the states that they are accessible in.

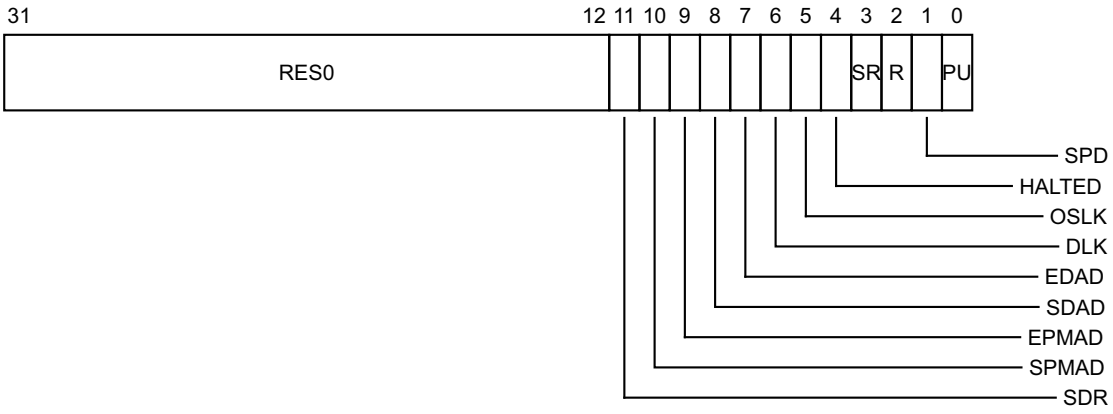
If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If EDPRSR.DLK == 0, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

**Configurations**



EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

**Attributes**

EDPRSR is a 32-bit register.

### Field descriptions

The EDPRSR bit assignments are:

**Bits [31:12]**

Reserved, RES0.

**SDR, bit [11]**

Sticky debug restart. Set to 1 when the PE exits Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This bit is UNKNOWN on reads if any of the following are true:

- DoubleLockStatus() == TRUE (EDPRSR.DLK == 1). The OS double-lock is locked.
- EDPRSR.R == 1. The PE is in Reset state.
- CorePoweredUp() == FALSE (EDPRSR.PU == 0). The Core power domain is powered down.

Otherwise permitted values are:

`0` The PE has not restarted since EDPRSR was last read.

`1` The PE has restarted since EDPRSR was last read.

**Note**

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to infer the PE has left Debug state in this case.

If DoubleLockStatus() == FALSE then following a read of EDPRSR, this bit clears to 0. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | SLK | Default |
|---|---|---|---|
| UNK | UNK | RO | RC |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**SPMAD, bit [10]**

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

This bit is UNKNOWN on reads if any of EDPRSR.{DLK, OSLK, R} is 1, or EDPRSR.PU is 0.

Otherwise permitted values are:

`0` No accesses to the external Performance Monitors registers have failed since EDPRSR was last read.

`1` At least one access to the external Performance Monitors registers has failed since EDPRSR was last read.

If DoubleLockStatus() == FALSE then following a read of EDPRSR, this bit clears to 0. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

| Off | DLK | SLK | Default |
|---|---|---|---|
| UNK | UNK | RO | RC |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EPMAD, bit [9]**

External Performance Monitors access disable status.

This bit is UNKNOWN on reads if any of EDPRSR.{DLK, OSLK, R} is 1, or EDPRSR.PU is 0.

Otherwise permitted values are:

`0` External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.

`1` External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

If external performance monitors access is not implemented, EPMAD is RAO.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | Default |
|---|---|---|
| UNK | UNK | RO |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**SDAD, bit [8]**

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

This bit is UNKNOWN on reads if any of the following are true:

- Either of EDPRSR.{DLK, R} is 1.
- EDPRSR.PU is 0.
- EDPRSR.OSLK is 1 and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

Otherwise permitted values are:

`0` No accesses to the external debug registers have failed since EDPRSR was last read.

`1` At least one access to the external debug registers has failed since EDPRSR was last read.

If DoubleLockStatus() == FALSE then following a read of EDPRSR, this bit clears to 0. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

| Off | DLK | SLK | Default |
|---|---|---|---|
| UNK | UNK | RO | RC |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**EDAD, bit [7]**

External debug access disable status.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This bit is UNKNOWN on reads if any of the following are true:

- Either of EDPRSR.{DLK, R} is 1.
- EDPRSR.PU is 0.
- EDPRSR.OSLK is 1 and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

Otherwise permitted values are:

`0` External debug access enabled. AllowExternalDebugAccess() == TRUE.

`1` External debug access disabled. AllowExternalDebugAccess() == FALSE.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | EDAD | Default |
|---|---|---|---|
| UNK | UNK | RAO | RAZ |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**DLK, bit [6]**

OS Double Lock status bit. Returns the result of the pseudocode function DoubleLockStatus().

This bit is UNKNOWN on reads if EDPRSR.PU is 0.

Otherwise reads as zero if any of the following are true, that is when DoubleLockStatus() == FALSE:

- OSDLR_EL1.DLK == 0.
- DBGPRCR_EL1.CORENPDRQ == 1.
- The PE is in Debug state.

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 0, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 1, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | Default |
|---|---|---|
| UNK | RAO | RAZ |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**OSLK, bit [5]**

OS lock status bit.

This bit is UNKNOWN on reads if either of EDPRSR.{DLK, R} is 1 or EDPRSR.PU is 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

A read of this bit returns the value of OSLSR_EL1.OSLK.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | OSLK | Default |
|---|---|---|---|
| UNK | UNK | RAO | RAZ |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**HALTED, bit [4]**

Halted status bit.

This bit is UNKNOWN on reads if EDPRSR.PU is 0.

Otherwise permitted values are:

`0` EDSCR.STATUS is `0b000010` (PE in Non-debug state).

`1` EDSCR.STATUS is not `0b000010`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | Default |
|---|---|---|
| UNK | RAZ | RO |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**SR, bit [3]**

Sticky core reset status bit.

This bit is UNKNOWN on reads if EDPRSR.DLK is 1 or EDPRSR.PU is 0.

Otherwise permitted values are:

`0` The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.

`1` The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If DoubleLockStatus() == FALSE then following a read of EDPRSR, this bit clears to 0 if the non-debug logic of the PE is not in reset state. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to `1`.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field is accessible as shown below:

| Off | DLK | SLK | Default |
|---|---|---|---|
| UNK | UNK | RO | RC |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**R, bit [2]**

Core reset status bit.

This bit is UNKNOWN on reads if either EDPRSR.DLK is 1 or EDPRSR.PU is 0.

Otherwise permitted values are:

`0` The non-debug logic of the PE is not in reset state.

`1` The non-debug logic of the PE is in reset state.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | DLK | Default |
|---|---|---|
| UNK | UNK | RO |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**SPD, bit [1]**

Sticky core powerdown status bit.

This bit is UNKNOWN on reads if both EDPRSR.DLK and EDPRSR.PU are 1.

Otherwise, permitted values are:

`0` If the Core power domain is in a low-power or powerdown state (EDPRSR.PU is 0), it is not known whether the state of the debug registers in the Core power domain is lost.
If the Core power domain is in a powerup state (EDPRSR.PU is 1), the state of the debug registers in the Core power domain has not been lost.

`1` The state of the debug registers in the Core power domain is lost.

If DoubleLockStatus() == FALSE and the PE is not in the powerdown state, then following a read of EDPRSR, this bit clears to 0. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If DoubleLockStatus() == TRUE and the PE is not in the powerdown state, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

There are two logical states for the Core power domain when EDPRSR.PU is 0:

`Retention` The state of the debug registers, including EDPRSR.SPD, in the Core power domain is preserved, and restored on leaving retention state.

`Powerdown` The state of the debug registers in the Core power domain is lost, and a Cold reset is asserted on leaving powerdown state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In these states, EDPRSR.SPD is not cleared following a read of EDPRSR, and it is IMPLEMENTATION DEFINED whether:

- EDPRSR.SPD shows whether the state of the debug registers in the Core power domain has been lost since the last time EDPRSR was read when the Core power domain was powered up. That is:
  - While in the powerdown state, EDPRSR.SPD is RAO, as the state of the debug registers has been lost.
  - While in the retention state, the value of EDPRSR.EPD is unchanging and shows whether the state of the debug registers was lost before entering retention state. This does not allow EDPRSR.SPD to be fixed RAO in the retention state, as the state of the debug registers in the Core power domain is not lost by entering this state. EDPRSR.SPD can read as either 0 or 1.
- EDPRSR.SPD reads-as-zero, and:
  - On leaving the powerdown state, EDPRSR.SPD is set to 1, as the state of the debug registers has been lost.
  - On leaving the retention state, EDPRSR.SPD reverts to the value it had on entering retention state.

ARM recommends that an implementation make EDPRSR.SPD fixed RAO when in the powerdown state, particularly if it does not support a low-power retention state.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

| Off | DLK | SLK | Default |
|---|---|---|---|
| RO | UNK | RO | RC |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**PU, bit [0]**

Core powerup status bit. Indicates whether the Core power domain debug registers can be accessed.

The value of EDPRSR.PU is IMPLEMENTATION DEFINED when the OS double-lock is locked. See the description of DLK for more information.

Otherwise, permitted values are:

`0` Core is in a low-power or powerdown state where the debug registers cannot be accessed.

`1` Core is in a powerup state where the debug registers can be accessed.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

| Off | Default |
|---|---|
| RAZ | RAO |

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-4958. The priority at which each condition applies is from highest priority on the left to lowest on the right.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the EDPRSR:

EDPRSR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x314 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.41 EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

**Purpose**

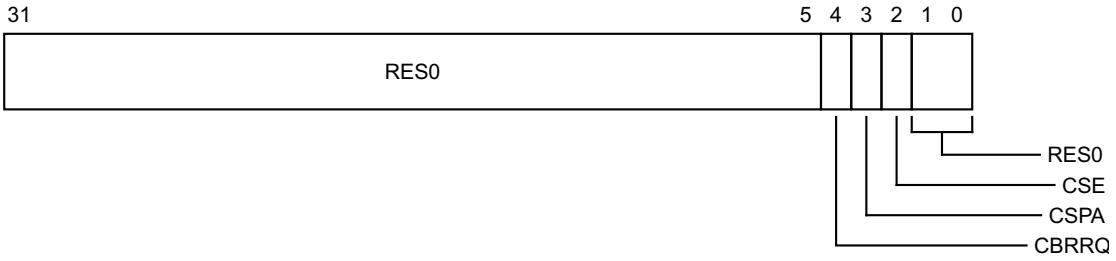
This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | WI | WO |

**Configurations**



EDRCR is in the Core power domain.

**Attributes**

EDRCR is a 32-bit register.

## Field descriptions

The EDRCR bit assignments are:

**Bits [31:5]**

Reserved, RES0.

**CBRRQ, bit [4]**

Allow imprecise entry to Debug state. The actions on writing to this bit are:

0 No action.

1 Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

**CSPA, bit [3]**

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

0 No action.

1 Clear the EDSCR.PipeAdv bit to 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CSE, bit [2]**

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

`0` No action.

`1` Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.

**Bits [1:0]**

Reserved, RES0.

## Accessing the EDRCR:

EDRCR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | `0x090` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.2.42 EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

**Purpose**

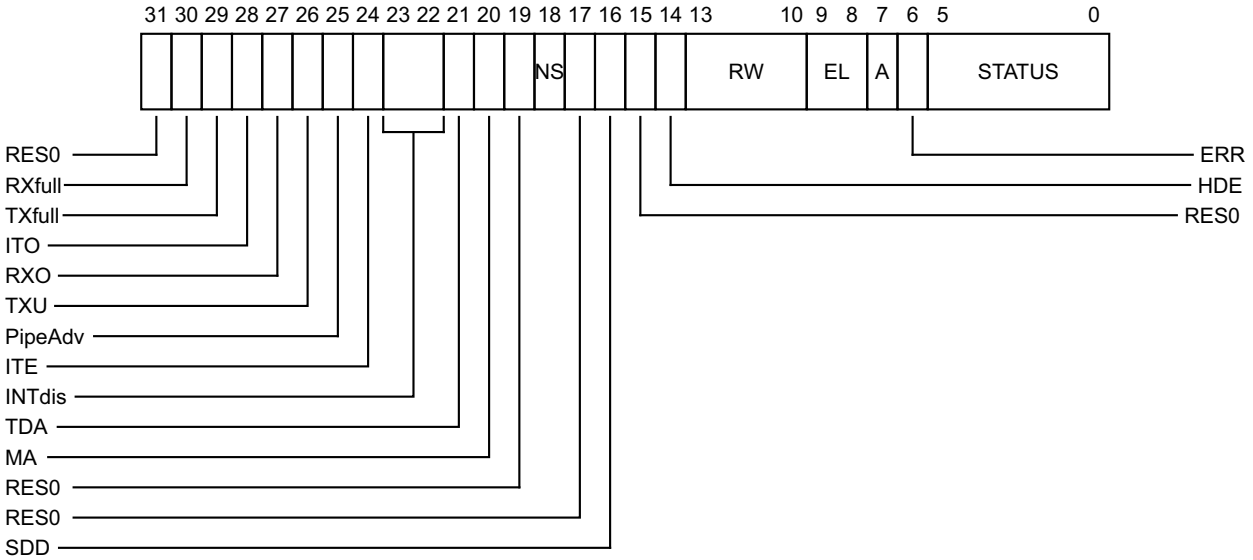
Main control register for the debug implementation.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | SLK | Default |
|---|---|---|---|---|
| Error | Error | Error | RO | RW |

**Configurations**



EDSCR is in the Core power domain.

**Attributes**

EDSCR is a 32-bit register.

### Field descriptions

The EDSCR bit assignments are:

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

**TXfull, bit [29]**

DTRTX full. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to `0`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field resets to its defined reset value on Cold reset.

**ITO, bit [28]**

EDITR overrun. This bit is RO.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

**RXO, bit [27]**

DTRRX overrun. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

**TXU, bit [26]**

DTRTX underrun. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

**PipeAdv, bit [25]**

Pipeline advance. Read-only. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to EDRCR.CSPA.

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

**ITE, bit [24]**

ITR empty. This bit is RO.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

**INTdis, bits [23:22]**

Interrupt disable. Disables taking interrupts (including virtual interrupts and System Error interrupts) in Non-Debug state.

If external invasive debug is disabled, the value of this field is ignored.

If external invasive debug is enabled, the possible values of this field are:

`00` Do not disable interrupts

`01` Disable interrupts taken to Non-secure EL1.

`10` Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If external secure invasive debug is enabled, also disable interrupts taken to Secure EL1.

`11` Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If external secure invasive debug is enabled, also disable all other interrupts.

The value of INTdis does not affect whether an interrupt is a WFI wake-up event, but can mask an interrupt as a WFE wake-up event.

If EL3 and EL2 are not implemented, INTdis[0] is RO and reads the same value as INTdis[1], meaning only the values `00` and `11` can be selected.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Cold reset.

**TDA, bit [21]**

Traps accesses to the following Debug System registers:

- AArch64: DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1.
- AArch32: DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.

The possible values of this field are:

`0` Accesses to Debug System registers do not generate a Software Access debug event.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Accesses to Debug System registers generate a Software Access debug event, if OSLSR.OSLK is 0 and if halting is allowed.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

**MA, bit [20]**

Memory access mode. Controls use of memory-access mode for accessing EDITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

0 Normal access mode.

1 Memory access mode.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

**Bit [19]**

Reserved, RES0.

**NS, bit [18]**

Non-secure status. Read-only. When in Debug state, gives the current Security state:

0 Secure state, IsSecure() == TRUE.

1 Non-secure state, IsSecure() == FALSE.

In Non-debug state, this bit is UNKNOWN.

**Bit [17]**

Reserved, RES0.

**SDD, bit [16]**

Secure debug disabled. This bit is RO.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization operation is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

**Bit [15]**

Reserved, RES0.

**HDE, bit [14]**

Halting debug enable.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**RW, bits [13:10]**

Exception level Execution state status. Read-only. In Debug state, each bit gives the current Execution state of each EL:

| RW | Meaning |
|---|---|
| 1111 | All Exception levels are using AArch64. |
| 1110 | EL0 is using AArch32. All other Exception levels are using AArch64. |
| 110x | EL0 and EL1 are using AArch32. All other Exception levels are using AArch64. Never seen if EL2 is not implemented in the current Security state. |
| 10xx | EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. All other Exception levels are using AArch64. |
| 0xxx | All Exception levels are using AArch32. |

However:

- The value of 1110 is only permitted at EL0.
- The values 110x are not permitted if either:
  - EL2 is not implemented.
  - EL3 is implemented and SCR_EL3.NS/SCR.NS == 0.
- The values 10xx are not permitted if EL3 is not implemented.

In Non-debug state, this field is RAO.

**EL, bits [9:8]**

Exception level. Read-only. In Debug state, this gives the current EL of the PE.

In Non-debug state, this field is RAZ.

**A, bit [7]**

System Error interrupt pending. Read-only. In Debug state, indicates whether a SError interrupt is pending:

- If HCR_EL2.{AMO, TGE} = {1, 0} and in Non-secure EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

0 No SError interrupt pending.

1 SError interrupt pending.

A debugger can read EDSCR to check whether a SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

**ERR, bit [6]**

Cumulative error flag. This field is RO. It is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

**STATUS, bits [5:0]**

Debug status flags. This field is RO.

The possible values of this field are:

000010 PE is in Non-debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

| | |
|---|---|
| 000001 | PE is restarting (exiting Debug state). |
| 000111 | Breakpoint. |
| 010011 | External debug request. |
| 011011 | Halting step, normal. |
| 011111 | Halting step, exclusive. |
| 100011 | OS unlock catch. |
| 100111 | Reset catch. |
| 101011 | Watchpoint. |
| 101111 | HLT instruction. |
| 110011 | Software access to debug register. |
| 110111 | Exception catch. |
| 111011 | Halting step, no syndrome. |

All other values of STATUS are reserved.

### Accessing the EDSCR:

EDSCR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x088 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.43 EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

**Purpose**

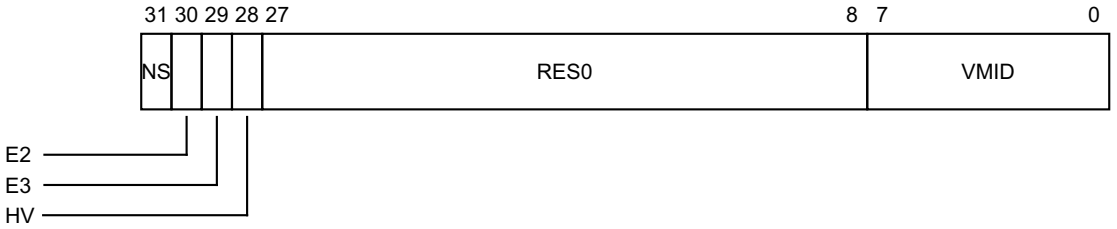
Contains sampled values captured on reading EDPCSR.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | Default |
|---|---|---|---|
| Error | Error | Error | RO |

**Configurations**



EDVIDSR is in the Core power domain.

**Attributes**

EDVIDSR is a 32-bit register.

## Field descriptions

The EDVIDSR bit assignments are:

**NS, bit [31]**

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**E2, bit [30]**

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2. If EDVIDSR.NS == 0, this bit is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**E3, bit [29]**

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with AArch64 EL3. If EDVIDSR.NS == 1 or the PE was in AArch32 state when EDPCSR was read, this bit is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**HV, bit [28]**

EDPCSR high half valid. Indicates whether bits [63:32] of the most recent EDPCSR sample are valid. If EDVIDSR.HV == 0, the value of EDPCSR[63:32] is RAZ.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [27:8]**

Reserved, RES0.

**VMID, bits [7:0]**

VMID sample. The value of VTTBR_EL2.VMID associated with the most recent EDPCSR sample. If EDVIDSR.NS == 0 or EDVIDSR.E2 == 1, this field is RAZ.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

## Accessing the EDVIDSR:

EDVIDSR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x0A8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.44 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

**Purpose**

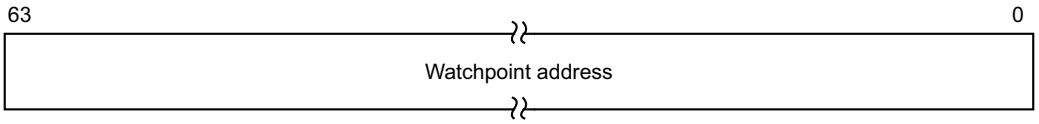
Contains the virtual data address being accessed when a watchpoint debug event was triggered.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | Default |
|---|---|---|---|
| Error | Error | Error | RO |

**Configurations**



EDWAR is in the Core power domain.

**Attributes**

EDWAR is a 64-bit register.

#### Field descriptions

The EDWAR bit assignments are:

**Bits [63:0]**

Watchpoint address. The virtual data address being accessed when a watchpoint debug event was triggered and caused entry to Debug state.

UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a watchpoint debug event.

The address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

#### Accessing the EDWAR:

EDWAR[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x030 |

EDWAR[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x034 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.2.45 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Usage constraints**

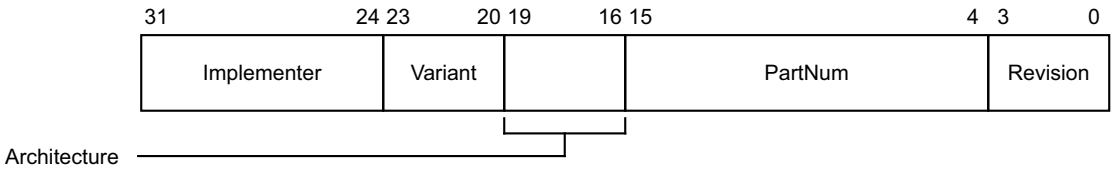
This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

External register MIDR_EL1 is architecturally mapped to AArch64 System register MIDR_EL1.

External register MIDR_EL1 is architecturally mapped to AArch32 System register MIDR.



MIDR_EL1 is in the Debug power domain.

**Attributes**

MIDR_EL1 is a 32-bit register.

## Field descriptions

The MIDR_EL1 bit assignments are:

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

| Hex representation | ASCII representation | Implementer |
|---|---|---|
| 0x41 | A | ARM Limited |
| 0x42 | B | Broadcom Corporation |
| 0x43 | C | Cavium Inc. |
| 0x44 | D | Digital Equipment Corporation |
| 0x49 | I | Infineon Technologies AG |
| 0x4D | M | Motorola or Freescale Semiconductor Inc. |
| 0x4E | N | NVIDIA Corporation |
| 0x50 | P | Applied Micro Circuits Corporation |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

| Hex representation | ASCII representation | Implementer |
|---|---|---|
| 0x51 | Q | Qualcomm Inc. |
| 0x56 | V | Marvell International Ltd. |
| 0x69 | i | Intel Corporation |

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

The permitted values of this field are:

0001 ARMv4

0010 ARMv4T

0011 ARMv5 (obsolete)

0100 ARMv5T

0101 ARMv5TE

0110 ARMv5TEJ

0111 ARMv6

1111 Architectural features are individually identified in the ID_* registers, see *Identification registers, functional group* on page G4-4162.

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

## Accessing the MIDR_EL1:

MIDR_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0xD00 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.2.46 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Usage constraints**

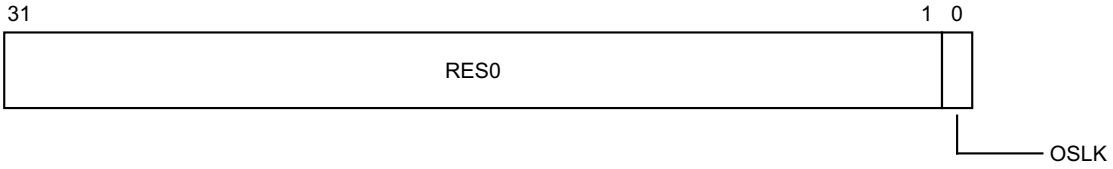
This register is accessible as follows:

| Off | DLK | SLK | Default |
|---|---|---|---|
| Error | Error | WI | WO |

**Configurations**

External register OSLAR_EL1 is architecturally mapped to AArch64 System register OSLAR_EL1.

External register OSLAR_EL1 is architecturally mapped to AArch32 System register DBGOSLAR.



OSLAR_EL1 is in the Core power domain.

**Attributes**

OSLAR_EL1 is a 32-bit register.

### Field descriptions

The OSLAR_EL1 bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.

Use EDPRSR.OSLK to check the current status of the lock.

### Accessing the OSLAR_EL1:

OSLAR_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| Debug | 0x300 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## H9.3 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

**Purpose**

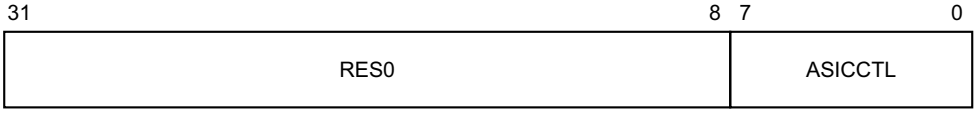
Provides a control for external multiplexing of additional triggers into the CTI.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



ASICCTL is in the Debug power domain.

**Attributes**

ASICCTL is a 32-bit register.

#### Field descriptions

The ASICCTL bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**ASICCTL, bits [7:0]**

IMPLEMENTATION DEFINED ASIC control. Provides a control for external multiplexing of additional triggers into the CTI.

If external multiplexing of trigger signals is implemented then the number of multiplexed signals on each trigger must be reflected in CTIDEVID.EXTMUXNUM.

If CTIDEVID.EXTMUXNUM is zero, this field is RAZ.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an architecturally UNKNOWN value.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.

#### Accessing the ASICCTL:

ASICCTL can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0x144 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

**Purpose**

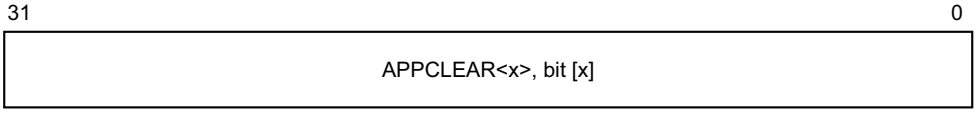
Clears bits of the Application Trigger register.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | WO |

**Configurations**



CTIAPPCLEAR is in the Debug power domain.

**Attributes**

CTIAPPCLEAR is a 32-bit register.

#### Field descriptions

The CTIAPPCLEAR bit assignments are:

**APPCLEAR<x>, bit [x], for x = 0 to 31**

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

`0` No effect.

`1` Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPPULSE.

#### Accessing the CTIAPPCLEAR:

CTIAPPCLEAR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x018` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

**Purpose**

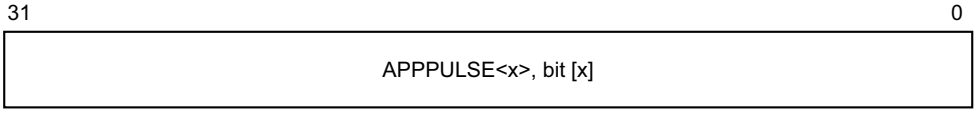
Causes event pulses to be generated on ECT channels.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | WO |

**Configurations**



CTIAPPPULSE is in the Debug power domain.

**Attributes**

CTIAPPPULSE is a 32-bit register.

#### Field descriptions

The CTIAPPPULSE bit assignments are:

**APPPULSE<x>, bit [x], for x = 0 to 31**

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

`0` No effect.

`1` Channel <x> event pulse generated for one clock period.

#### Accessing the CTIAPPPULSE:

CTIAPPPULSE can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x01C` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

**Purpose**

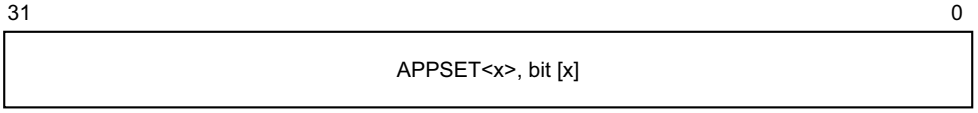
Sets bits of the Application Trigger register.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



CTIAPPSET is in the Debug power domain.

**Attributes**

CTIAPPSET is a 32-bit register.

#### Field descriptions

The CTIAPPSET bit assignments are:

**APPSET<x>, bit [x], for x = 0 to 31**

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

`0` Reading this means the application trigger is inactive. Writing this has no effect.

`1` Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPPULSE.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on External debug reset.

#### Accessing the CTIAPPSET:

CTIAPPSET can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x014` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

**Usage constraints**

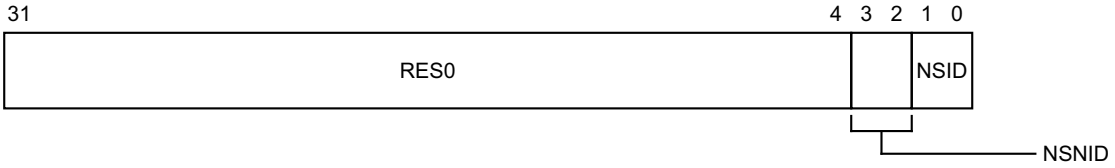
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.



CTIAUTHSTATUS.{SNID,SID} are RAZ, because the CTI does not itself provide Secure authentication.

**Attributes**

CTIAUTHSTATUS is a 32-bit register.

## Field descriptions

The CTIAUTHSTATUS bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**NSNID, bits [3:2]**

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as DBGAUTHSTATUS_EL1.SNID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSNID.

**NSID, bits [1:0]**

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSID.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFB8 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

**Purpose**

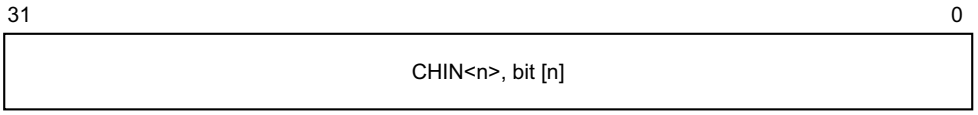
Provides the raw status of the ECT channel inputs to the CTI.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTICHINSTATUS is in the Debug power domain.

**Attributes**

CTICHINSTATUS is a 32-bit register.

#### Field descriptions

The CTICHINSTATUS bit assignments are:

**CHIN<n>, bit [n], for n = 0 to 31**

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

`0` Input channel <n> is inactive.

`1` Input channel <n> is active.

#### Accessing the CTICHINSTATUS:

CTICHINSTATUS can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x138` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

**Purpose**

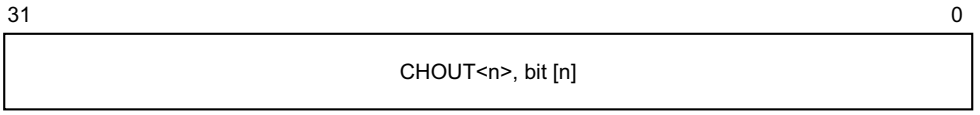
Provides the status of the ECT channel outputs from the CTI.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTICHOUTSTATUS is in the Debug power domain.

**Attributes**

CTICHOUTSTATUS is a 32-bit register.

#### Field descriptions

The CTICHOUTSTATUS bit assignments are:

**CHOUT<n>, bit [n], for n = 0 to 31**

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

`0` Output channel <n> is inactive.

`1` Output channel <n> is active.

#### Accessing the CTICHOUTSTATUS:

CTICHOUTSTATUS can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x13C` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

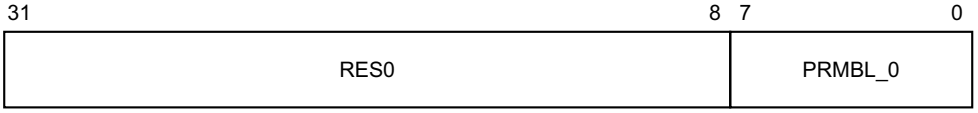
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTICIDR0 is in the Debug power domain.

CTICIDR0 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

#### Field descriptions

The CTICIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as `0x0D`.

#### Accessing the CTICIDR0:

CTICIDR0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFF0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

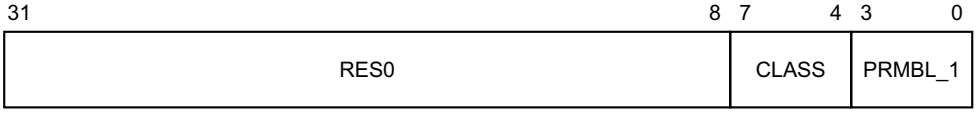
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTICIDR1 is in the Debug power domain.

CTICIDR1 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

#### Field descriptions

The CTICIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as `0x9`, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

#### Accessing the CTICIDR1:

CTICIDR1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFF4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

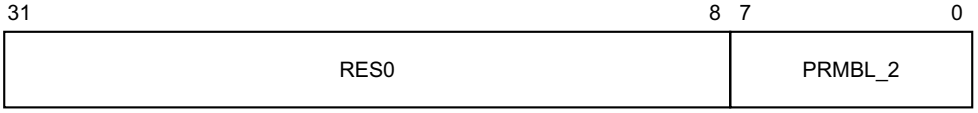
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTICIDR2 is in the Debug power domain.

CTICIDR2 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTICIDR2 is a 32-bit register.

#### Field descriptions

The CTICIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as `0x05`.

#### Accessing the CTICIDR2:

CTICIDR2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFF8` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

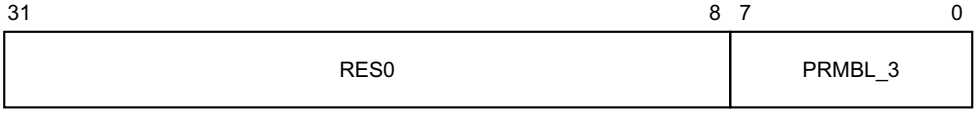
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTICIDR3 is in the Debug power domain.

CTICIDR3 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTICIDR3 is a 32-bit register.

#### Field descriptions

The CTICIDR3 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as `0xB1`.

#### Accessing the CTICIDR3:

CTICIDR3 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFFC` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.12 CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

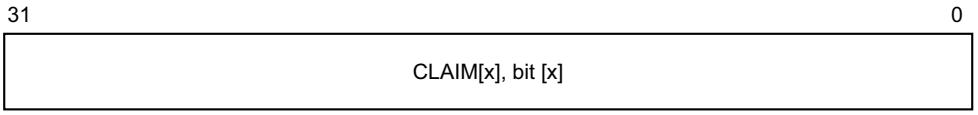
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**

CTICLAIMCLR is in the Debug power domain.



CTICLAIMCLR is optional to implement in the external register interface.

**Attributes**

CTICLAIMCLR is a 32-bit register.

#### Field descriptions

The CTICLAIMCLR bit assignments are:

**CLAIM[x], bit [x], for x = 0 to 31**

Clear CLAIM tag. If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

Otherwise, reads return the value of CLAIM[x] and the behavior on writes is:

`0` No action.

`1` Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

#### Accessing the CTICLAIMCLR:

CTICLAIMCLR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFA4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.13 CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

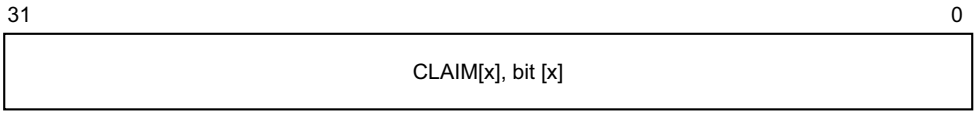
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**

CTICLAIMSET is in the Debug power domain.



CTICLAIMSET is optional to implement in the external register interface.

**Attributes**

CTICLAIMSET is a 32-bit register.

#### Field descriptions

The CTICLAIMSET bit assignments are:

**CLAIM[x], bit [x], for x = 0 to 31**

CLAIM tag set bit. If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

Otherwise, the bit is RAO and the behavior on writes is:

`0` No action.

`1` Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

#### Accessing the CTICLAIMSET:

CTICLAIMSET can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFA0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

**Purpose**

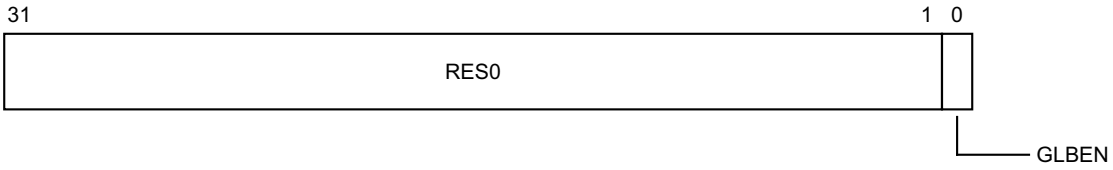
Controls whether the CTI is enabled.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



CTICONTROL is in the Debug power domain.

**Attributes**

CTICONTROL is a 32-bit register.

#### Field descriptions

The CTICONTROL bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**GLBEN, bit [0]**

Enables or disables the CTI mapping functions. Possible values of this field are:

`0` CTI mapping functions disabled.

`1` CTI mapping functions enabled.

When the mapping functions are disabled, no new events are signaled on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on External debug reset.

#### Accessing the CTICONTROL:

CTICONTROL can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x000` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.15 CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

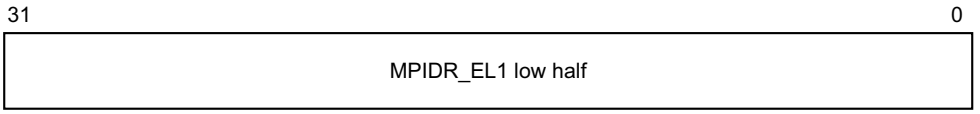
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIDEVAFF0 is in the Debug power domain.



CTIDEVAFF0 is optional to implement in the external register interface.

**Attributes**

CTIDEVAFF0 is a 32-bit register.

#### Field descriptions

The CTIDEVAFF0 bit assignments are:

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

#### Accessing the CTIDEVAFF0:

CTIDEVAFF0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFA8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

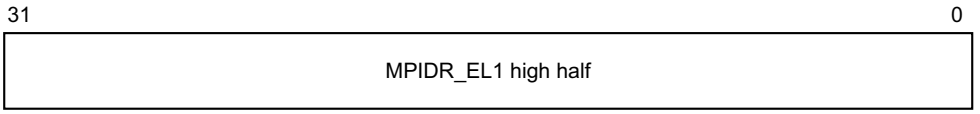
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIDEVAFF1 is in the Debug power domain.



CTIDEVAFF1 is optional to implement in the external register interface.

**Attributes**

CTIDEVAFF1 is a 32-bit register.

#### Field descriptions

The CTIDEVAFF1 bit assignments are:

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

#### Accessing the CTIDEVAFF1:

CTIDEVAFF1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFAC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the CTI component.

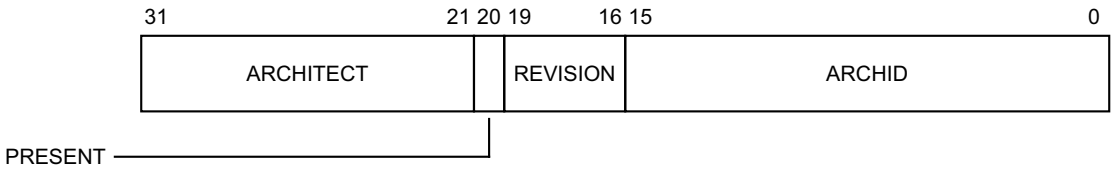
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIDEVARCH is in the Debug power domain.



CTIDEVARCH is optional to implement in the external register interface.

**Attributes**

CTIDEVARCH is a 32-bit register.

#### Field descriptions

The CTIDEVARCH bit assignments are:

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For CTI, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, `0x4`.

Bits [27:21] are the JEP 106 ID code, `0x3B`.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For CTI, the revision defined by ARMv8 is `0x0`.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, `0x1`.
- Bits [11:0] are the architecture part number, `0xA14`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This corresponds to CTI architecture version CTIv2.

### Accessing the CTIDEVARCH:

CTIDEVARCH can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFBC |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.18 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

**Purpose**

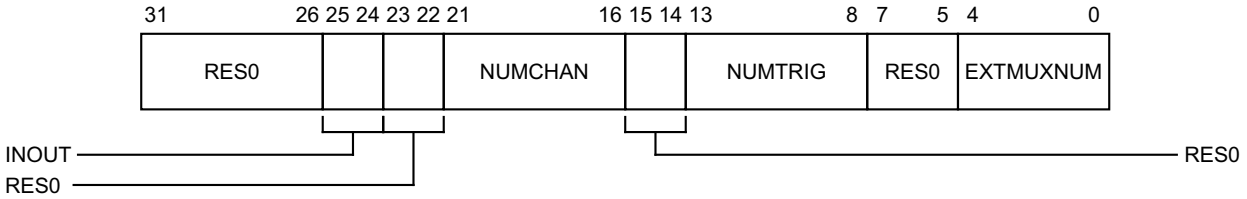
Describes the CTI component to the debugger.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTIDEVID is in the Debug power domain.

**Attributes**

CTIDEVID is a 32-bit register.

## Field descriptions

The CTIDEVID bit assignments are:

**Bits [31:26]**

Reserved, RES0.

**INOUT, bits [25:24]**

Input/output options. Indicates presence of the input gate. If the CTM is not implemented, this field is RAZ.

`00` CTIGATE does not mask propagation of input events from external channels.

`01` CTIGATE masks propagation of input events from external channels.

All other values are reserved.

**Bits [23:22]**

Reserved, RES0.

**NUMCHAN, bits [21:16]**

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For ARMv8, valid values are:

`000011` 3 channels (0..2) implemented.

`000100` 4 channels (0..3) implemented.

`000101` 5 channels (0..4) implemented.

`000110` 6 channels (0..5) implemented.

and so on up to `100000`, 32 channels (0..31) implemented.

All other values are reserved.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [15:14]**

Reserved, RES0.

**NUMTRIG, bits [13:8]**

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For ARMv8, valid values are:

`000011` Up to 3 triggers (0..2) implemented.

`001000` Up to 8 triggers (0..7) implemented.

`001001` Up to 9 triggers (0..8) implemented.

`001010` Up to 10 triggers (0..9) implemented.

and so on up to `100000`, 32 triggers (0..31) implemented.

All other values are reserved. If the implementation includes an ARM trace macrocell, this field must be at least `001000`. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

**Bits [7:5]**

Reserved, RES0.

**EXTMUXNUM, bits [4:0]**

Maximum number of external triggers available for multiplexing into the CTI. This relates only to additional external triggers outside those defined for ARMv8.

### Accessing the CTIDEVID:

CTIDEVID can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFC8` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.19 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

**Purpose**

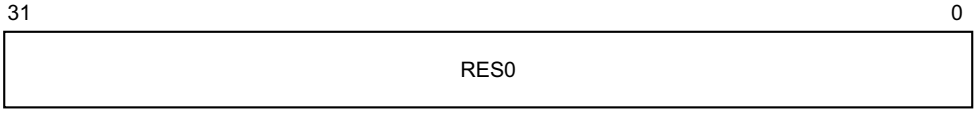
Reserved for future information about the CTI component to the debugger.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTIDEVID1 is in the Debug power domain.

**Attributes**

CTIDEVID1 is a 32-bit register.

#### Field descriptions

The CTIDEVID1 bit assignments are:

**Bits [31:0]**

Reserved, RES0.

#### Accessing the CTIDEVID1:

CTIDEVID1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFC4 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.20 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

**Purpose**

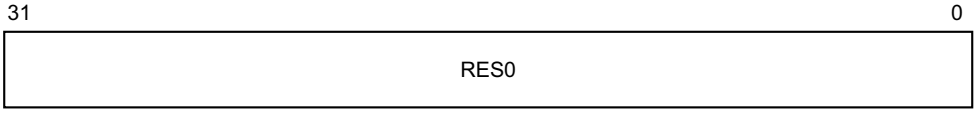
Reserved for future information about the CTI component to the debugger.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTIDEVID2 is in the Debug power domain.

**Attributes**

CTIDEVID2 is a 32-bit register.

#### Field descriptions

The CTIDEVID2 bit assignments are:

**Bits [31:0]**

Reserved, RES0.

#### Accessing the CTIDEVID2:

CTIDEVID2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFC0 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.21 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

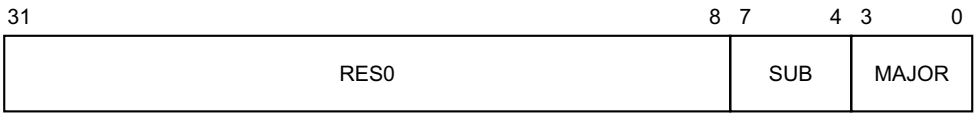
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIDEVTYPE is in the Debug power domain.



CTIDEVTYPE is optional to implement in the external register interface.

**Attributes**

CTIDEVTYPE is a 32-bit register.

#### Field descriptions

The CTIDEVTYPE bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as `0x1` to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as `0x4` to indicate this is a cross-trigger component.

#### Accessing the CTIDEVTYPE:

CTIDEVTYPE can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFCC` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.22 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

**Purpose**

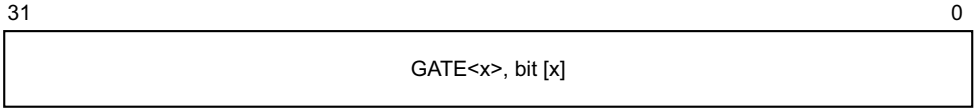
Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



CTIGATE is in the Debug power domain.

**Attributes**

CTIGATE is a 32-bit register.

#### Field descriptions

The CTIGATE bit assignments are:

**GATE<x>, bit [x], for x = 0 to 31**

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

`0` Disable output and, if CTIDEVID.INOUT == `0b01`, input channel <x> propagation.

`1` Enable output and, if CTIDEVID.INOUT == `0b01`, input channel <x> propagation.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on External debug reset.

#### Accessing the CTIGATE:

CTIGATE can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x140` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.23 CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

**Purpose**

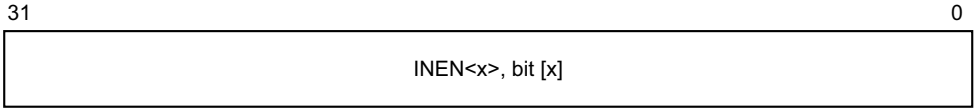
Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



CTIINEN<n> is in the Debug power domain.

**Attributes**

CTIINEN<n> is a 32-bit register.

#### Field descriptions

The CTIINEN<n> bit assignments are:

**INEN<x>, bit [x], for x = 0 to 31**

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

`0` Input trigger <n> will not generate an event on output channel <x>.

`1` Input trigger <n> will generate an event on output channel <x>.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on External debug reset.

#### Accessing the CTIINEN<n>:

CTIINEN<n> can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x020` + 4n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.24 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

**Purpose**

Can be used to create soft acknowledges for output triggers.

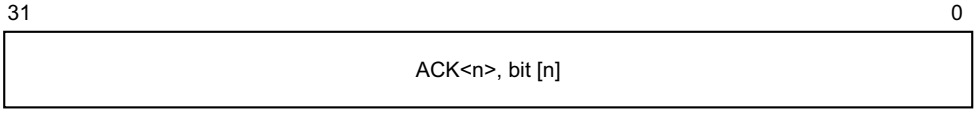
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | WO |

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK.

**Configurations**



CTIINTACK is in the Debug power domain.

**Attributes**

CTIINTACK is a 32-bit register.

## Field descriptions

The CTIINTACK bit assignments are:

**ACK<n>, bit [n], for n = 0 to 31**

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

`0` No effect

`1` Deactivate the trigger.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CTIINTACK:

CTIINTACK can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x010` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.25 CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

**Purpose**

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

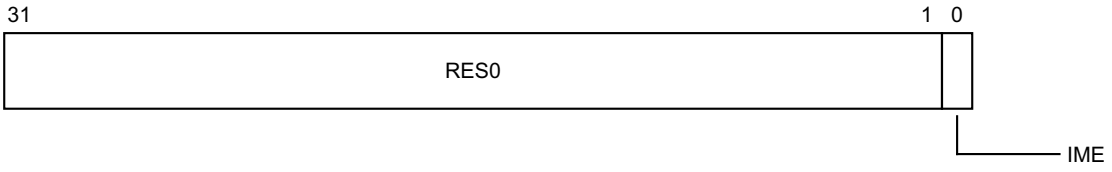
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RW |

**Configurations**

CTIITCTRL is in the Debug power domain.



CTIITCTRL is optional to implement in the external register interface.

**Attributes**

CTIITCTRL is a 32-bit register.

#### Field descriptions

The CTIITCTRL bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

`0` Normal operation.

`1` Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.

#### Accessing the CTIITCTRL:

CTIITCTRL can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xF00` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.26 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

**Purpose**

Allows or disallows access to the CTI registers through a memory-mapped interface.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| WO |

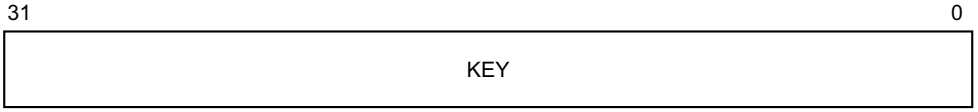
**Configurations**

CTILAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

CTILAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.



Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILAR is a 32-bit register.

#### Field descriptions

The CTILAR bit assignments are:

**KEY, bits [31:0]**

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

#### Accessing the CTILAR:

CTILAR can be accessed through the memory-mapped interface:

| Component | Offset |
|---|---|
| CTI | `0xFB0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.27 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

**Purpose**

Indicates the current status of the software lock for CTI registers.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

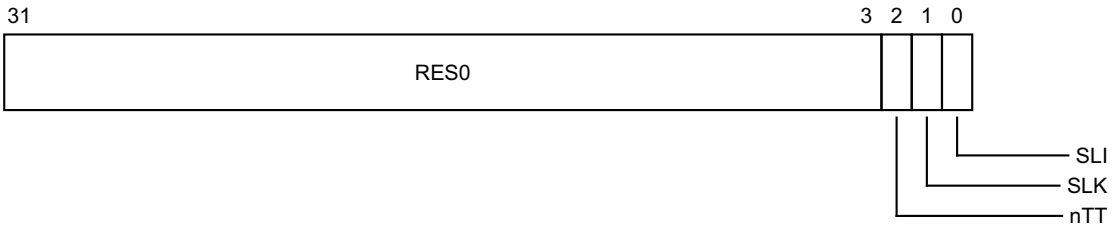
**Configurations**

CTILSR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

CTILSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.



Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILSR is a 32-bit register.

#### Field descriptions

The CTILSR bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

`0` Lock clear. Writes are permitted to this component's registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on External debug reset.

**SLI, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

0 Software lock not implemented or not memory-mapped access.

1 Software lock implemented and memory-mapped access.

### Accessing the CTILSR:

CTILSR can be accessed through the memory-mapped interface:

| Component | Offset |
|---|---|
| CTI | 0xFB4 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.28 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

**Purpose**

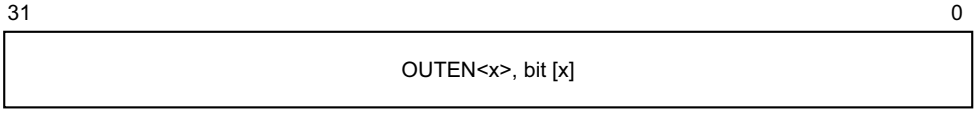
Defines which input channels generate output trigger n.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RW |

**Configurations**



CTIOUTEN<n> is in the Debug power domain.

**Attributes**

CTIOUTEN<n> is a 32-bit register.

#### Field descriptions

The CTIOUTEN<n> bit assignments are:

**OUTEN<x>, bit [x], for x = 0 to 31**

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

`0` An event on input channel <x> will not cause output trigger <n> to be asserted.

`1` An event on input channel <x> will cause output trigger <n> to be asserted.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on External debug reset.

#### Accessing the CTIOUTEN<n>:

CTIOUTEN<n> can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x0A0` + 4n |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.29 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

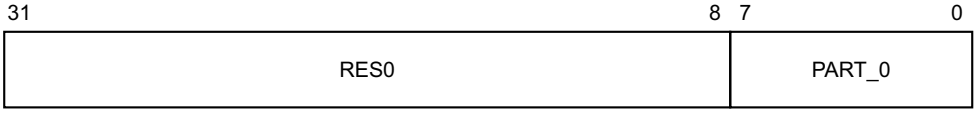
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIPIDR0 is in the Debug power domain.

CTIPIDR0 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTIPIDR0 is a 32-bit register.

#### Field descriptions

The CTIPIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

#### Accessing the CTIPIDR0:

CTIPIDR0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFE0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.30 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

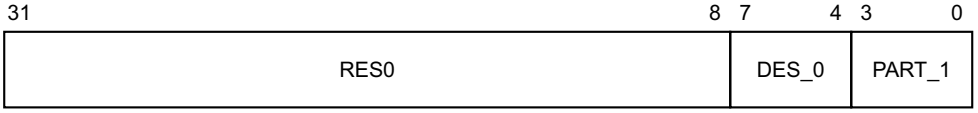
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIPIDR1 is in the Debug power domain.

CTIPIDR1 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

#### Field descriptions

The CTIPIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is `0b1011`.

**PART_1, bits [3:0]**

Part number, most significant nibble.

#### Accessing the CTIPIDR1:

CTIPIDR1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFE4` |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### H9.3.31 CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

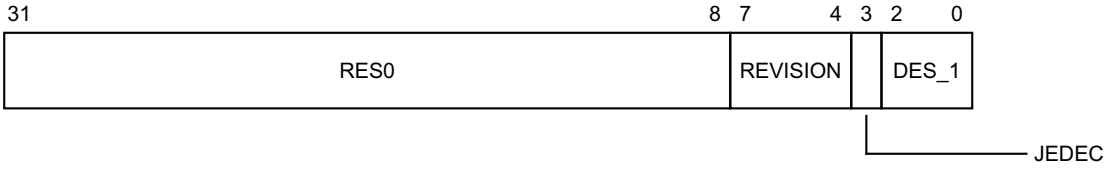
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIPIDR2 is in the Debug power domain.

CTIPIDR2 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTIPIDR2 is a 32-bit register.

#### Field descriptions

The CTIPIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is `0b011`.

#### Accessing the CTIPIDR2:

CTIPIDR2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFE8` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.32 CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

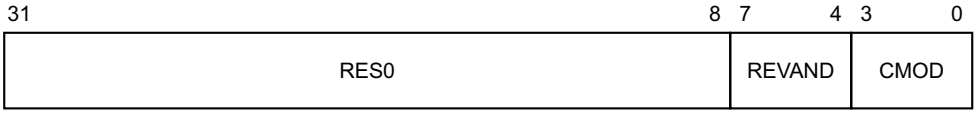
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIPIDR3 is in the Debug power domain.

CTIPIDR3 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTIPIDR3 is a 32-bit register.

#### Field descriptions

The CTIPIDR3 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

#### Accessing the CTIPIDR3:

CTIPIDR3 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | 0xFEC |

### H9.3.33 CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

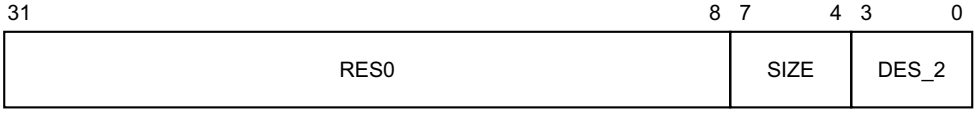
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

CTIPIDR4 is in the Debug power domain.

CTIPIDR4 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

#### Field descriptions

The CTIPIDR4 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. $Log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is `0b0100`.

#### Accessing the CTIPIDR4:

CTIPIDR4 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0xFD0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.34 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

**Purpose**

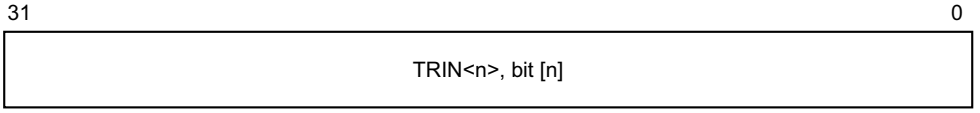
Provides the status of the trigger inputs.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTITRIGINSTATUS is in the Debug power domain.

**Attributes**

CTITRIGINSTATUS is a 32-bit register.

#### Field descriptions

The CTITRIGINSTATUS bit assignments are:

**TRIN<n>, bit [n], for n = 0 to 31**

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

Possible values of this bit are:

`0` Input trigger n is inactive.

`1` Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

#### Accessing the CTITRIGINSTATUS:

CTITRIGINSTATUS can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x130` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### H9.3.35 CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

**Purpose**

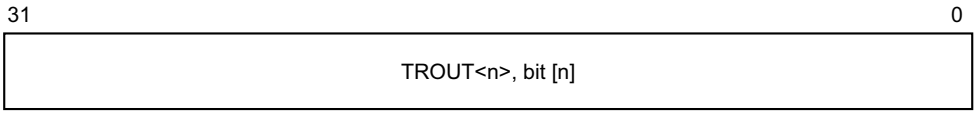
Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**



CTITRIGOUTSTATUS is in the Debug power domain.

**Attributes**

CTITRIGOUTSTATUS is a 32-bit register.

#### Field descriptions

The CTITRIGOUTSTATUS bit assignments are:

**TROUT<n>, bit [n], for n = 0 to 31**

Trigger output <n> status.

Bits [31:N] are RAZ, where N is the value of the CTIDEVID.NUMTRIG field.

If n < N, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

`0` Output trigger n is inactive.

`1` Output trigger n is active.

Otherwise when n < N it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

#### Accessing the CTITRIGOUTSTATUS:

CTITRIGOUTSTATUS can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| CTI | `0x134` |

# Part I

## Memory-mapped Components of the ARMv8 Architecture

# Chapter I1
# System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- *About the Generic Timer specification* on page I1-5098.
- *Memory-mapped counter module* on page I1-5099.
- *Counter module control and status register summary* on page I1-5102.
- *Memory-mapped timer components* on page I1-5104.
- *The CNTBaseN and CNTEL0BaseN frames* on page I1-5105.
- *The CNTCTLBase frame* on page I1-5107.
- *Providing a complete set of counter and timer features* on page I1-5108.
- *Gray-count scheme for timer distribution scheme* on page I1-5110.

**Note**

- *Generic Timer memory-mapped register descriptions* on page I3-5173 describes the System level Generic Timer registers. These registers are memory-mapped.
- Chapter D6 *The Generic Timer in AArch64 state* gives a general description of the AArch64 state view of the Generic Timer, and describes the AArch64 System register interface to the Generic Timer.
- Chapter G5 *The Generic Timer in AArch32 state* gives a general description of the AArch32 state view of the Generic Timer, and describes the AArch32 System register interface to the Generic Timer.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## I1.1 About the Generic Timer specification

Chapter D6 *The Generic Timer in AArch64 state* describes the ARM Generic Timer and its implementation as seen from AArch64 state. Chapter G5 *The Generic Timer in AArch32 state* describes the ARM Generic Timer and its implementation as seen from AArch32 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the ARM Generic Timer architecture requires the inclusion of a memory-mapped component, the memory-mapped counter module, to control the generation of the Count value used by the Generic Timers. This is described in *Memory-mapped counter module* on page I1-5099.

In addition, the Generic Timer architecture defines the architecture of an optional memory-mapped timer component. This gives a standardized way of providing timers for programmable system components other than PEs that implement the ARM architecture. *Memory-mapped timer components* on page I1-5104 describes this memory-mapped timer.

### I1.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into *frames*. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame is IMPLEMENTATION DEFINED.

**Note**

The final twelve words of the first or only 4KB block of a register memory frame is an ID block.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I1.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The CNTControlBase frame holds the registers for the memory-mapped counter, and provides:

- A RW control register CNTCR, that provides:
  - An enable bit for the system counter.
  - An enable bit for Halt-on-Debug. When this is enabled, if the debug halt signal into the system counter is asserted, it halts the system counter. Otherwise, the system counter ignores the state of this halt signal. For more information about Halt-on-Debug, contact ARM.
  - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. For more information see *Control of counter operating frequency and increment* on page I1-5100.

  Writes to this register are rare. In a system that supports two Security states, this register is writable only by Secure writes.
- A RO status register, CNTSR, that provides:
  - A bit that indicates whether the system counter is halted because of an asserted Halt-on-Debug signal.
  - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.
- Two contiguous 32-bit RW registers that hold the current system counter value, CNTCV. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

  The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.

  Writes to these registers are rare. In a system that supports two Security states, these registers are writable only by Secure writes.
- A table of one or more 32-bit entries, where:
  - The first entry defines the *base frequency* of the system counter. This is the maximum frequency at which the counter updates.
  - Each subsequent entry defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.

  A 32-bit zero entry immediately follows the last table entry.

  This table can be RO or RW. For more information, see *The frequency modes table* on page I1-5100.

In addition, the CNTReadBase frame includes a read-only copy of CNTCV, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

*Counter module control and status register summary* on page I1-5102 describes CNTReadBase and CNTControlBase memory maps, and the registers in each frame.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I1.2.1 Control of counter operating frequency and increment

The system counter has a fixed *base frequency*, and must maintain the required counter accuracy, meaning ARM recommends that it does not gain or lose more than ten seconds in a 24-hour period, see *System counter* on page D6-1899. However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- *The frequency modes table*.
- *Changing the system counter and increment*.

#### The frequency modes table

The frequency modes table starts at offset `0x20` from CNTControlBase.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base_frequency) / (selected_frequency)

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the CNTControlBase memory map shows the table region as RO or RW.

ARM strongly recommends that the frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the frequency modes table, and the maximum number of entries is IMPLEMENTATION DEFINED, up to this limit.

**Note**

ARM considers it likely that implementations will require significantly fewer entries than the architectural limit.

#### Changing the system counter and increment

The value of the CNTCR.FREQ field specifies which frequency modes table entry specifies the system counter update frequency.

Changing the value of CNTCR.FREQ requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

- When changing from a higher frequency to a lower frequency, the counter:
  1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
  2. Switches to operating at the lower frequency.
- When changing from a lower frequency to a higher frequency, the counter:
  1. Waits until the end of the current lower-frequency cycle.
  2. Makes the counter increment required for operation at that lower frequency.
  3. Switches to operating at the higher frequency.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When the frequency has changed, CNTSR is updated to indicate the new frequency. Therefore, a system component that is waiting for a frequency change can poll CNTSR to detect the change.

Non-Confidential - Beta

## I1.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory *frames*:

- A control frame, with base address CNTControlBase.
- A status frame, with base address CNTReadBase.

Each of these register memory frames is at least 4KB in size, or is at least the size of the memory protection granule if this granule size is larger than 4KB. Similarly, each base address must be aligned to 4KB, or to the memory protection granule if that is larger than 4KB.

**Note**

The memory protection granule is either 4KB, 16KB or 64KB.

In each register memory frame, the memory at offset `0xFD0-0xFFF` is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the CounterID<n> register descriptions for more information.

The counter is assumed to be little-endian.

In an implementation that supports Secure and Non-secure memory spaces, CNTControlBase is implemented only in the Secure memory space.

Table I1-1 shows the CNTControlBase control registers, in order of their offsets from CNTControlBase. *Generic Timer memory-mapped register descriptions* on page I3-5173 describes each of these registers.

**Table I1-1 CNTControlBase memory map**

| Offset | Name | Type | Description |
|---|---|---|---|
| `0x000` | CNTCR | RW | Counter Control Register. |
| `0x004` | CNTSR | RO | Counter Status Register. |
| `0x008` | CNTCV[31:0] | RW | Counter Count Value register. |
| `0x00C` | CNTCV[63:32] | RW | |
| `0x010-0x01C` | - | RES0 | Reserved. |
| `0x020` | CNTFID0 | RO or RW | Frequency modes table, and end marker.<br>CNTFID0 is the base frequency, and each CNTFID*n* is an alternative frequency. For more information see *The frequency modes table* on page I1-5100. |
| `0x020`+4*n* | CNTFID*n* | RO or RW | |
| (`0x024`+4*n*)-`0x0BC` | - | RES0 | Reserved. |
| `0x0C0-0x0FC` | - | IMPLEMENTATION DEFINED | Reserved for IMPLEMENTATION DEFINED registers. |
| `0x100-0xFCC` | - | RES0 | Reserved. |

## I1.4 Memory-mapped timer components

This part of the ARM Generic Timer specification defines an optional memory-mapped timer component. This can be placed close to any programmable system component that does not incorporate a System register mapped ARM Generic Timer, to provide equivalent time functionality to that system component.

The memory map consists of up to 8 timer *frames*. Each timer frame:

- Provides its own set of timers and associated interrupts.
- Is in its own memory protection region that is:
  - In its own memory protection region, with a system-defined size of 4KB, 16KB or 64KB.
  - At a start address that is aligned to 4KB.

  **Note**

  The 4KB alignment requirement applies regardless of the memory protection region size.

The base address of a frame is CNTBase*N*, where *N* numbers from 0 up to a maximum permitted value of 7.

**Note**

In the naming of the registers associated with a CNTBase*N* frame, the value of N is represented as <n>, for example CNTACR<n>.

For each implemented CNTBase*N* frame the system can optionally provide an EL0 view of the frame. The base address of this second view of the CNTBase*N* frame is CNTEL0Base*N*.

If CNTEL0Base*N* is implemented:

- All registers visible in CNTBase*N* are visible, except for CNTVOFF and CNTEL0ACR.
- The offsets of all visible registers are the same as their offsets in the CNTBase*N* frame.

In addition, the system provides a control frame at base address CNTCTLBase.

The memory protection region and alignment requirements for the CNTEL0Base*N* and CNTCTLBase frames are the same as the requirements for the CNTBase*N* frames.

The system defines the position of each frame in the memory map. This means the values of each of the CNTBase*N*, CNTEL0Base*N*, and CNTCTLBase base addresses is IMPLEMENTATION DEFINED.

The memory-mapped timers are assumed to be little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- *The CNTBaseN and CNTEL0BaseN frames* on page I1-5105.
- *The CNTCTLBase frame* on page I1-5107.
- *Providing a complete set of counter and timer features* on page I1-5108.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I1.5 The CNTBase*N* and CNTEL0Base*N* frames

Table I1-3 shows the CNTBase*N* registers, in order of their offsets from CNTBase*N*. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not then memory at offsets `0x030-0x03C` is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, equivalent registers are also implemented in the System register interface to the Generic Timer.

*Generic Timer memory-mapped register descriptions* on page I3-5173 describes each of these registers.

**Table I1-3 CNTBase*N* memory map**

| Offset | Register | Type | Description |
|---|---|---|---|
| `0x000` | CNTPCT[31:0][a] | RO | Physical Count register. |
| `0x004` | CNTPCT[63:32][a] | RO | |
| `0x008` | CNTVCT[31:0][a] | RO | Virtual Count register. |
| `0x00C` | CNTVCT[63:32][a] | RO | |
| `0x010` | CNTFRQ[a] | RO[c] | Counter Frequency register. |
| `0x014` | CNTEL0ACR | RW[b] | Counter EL0 Access Control Register, optional in the CNTBase*N* memory map. |
| `0x018` | CNTVOFF[31:0][a] | RO[c] | Virtual Offset register. If CNTVOFF<n> in the CNTCTLBase frame is a RW register, retains the value of that register. Otherwise is RAZ. |
| `0x01C` | CNTVOFF[63:32][a] | RO[c] | |
| `0x020` | CNTP_CVAL[31:0][a] | RW | Physical Timer CompareValue register. |
| `0x024` | CNTP_CVAL[63:32][a] | RW | |
| `0x028` | CNTP_TVAL[a] | RW | Physical TimerValue register. |
| `0x02C` | CNTP_CTL[a] | RW | Physical Timer Control register. |
| `0x030` | CNTV_CVAL[31:0][a] | RW[b] | Virtual Timer CompareValue register, optional in the CNTBase*N* memory map. |
| `0x034` | CNTV_CVAL[63:32][a] | RW[b] | |
| `0x038` | CNTV_TVAL[a] | RW[b] | Virtual TimerValue register, optional in the CNTBase*N* memory map. |
| `0x03C` | CNTV_CTL[a] | RW[b] | Virtual Timer Control register, optional in the CNTBase*N* memory map. |
| `0x040-0xFCF` | - | RES0 | Reserved. |
| `0xFD0-0xFFC` | CounterID<n> | RO | Counter ID registers 0-11. |

a. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers* on page D7-2276 and *Generic Timer registers* on page G6-4780. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

b. Address is reserved, RAZ/WI if register not implemented

c. The CNTCTLBase frame includes a RW view of this register.

CNTTIDR controls whether the CNTBase*N* and CNTEL0Base*N* frames are implemented.

For any value of *N*, the layout of the registers in the frame at CNTEL0Base*N* is identical to that at CNTBase*N*, except that, in the CNTEL0Base*N* frame:

- CNTVOFF is never visible, and the memory at `0x018-0x01C` is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at `0x014` is RAZ/WI.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If implemented in the frame at CNTBase*N*, CNTEL0ACR controls whether CNTPCT, CNTVCT, CNTFRQ, the EL1 Physical Timer, and the Virtual Timer registers are visible in the frame at CNTEL0Base*N*.

  If CNTEL0ACR is not implemented then these registers are not visible in the frame at CNTEL0Base*N*, and their addresses are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then CNTPCT, CNTVCT, CNTVOFF, CNTP_CVAL, and CNTV_CVAL must be accessible as atomic 64-bit values.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I1.6 The CNTCTLBase frame

The CNTCTLBase frame contains:

- An identification register for the features of the memory-mapped counter and timer implementation.
- Access controls for each CNTBase*N* frame.
- A virtual offset register for frames that implement a virtual timer.

Table I1-4 shows the CNTCTLBase registers, in order of their offsets from CNTCTLBase.

**Note**

CNTFRQ and CNTVOFF registers are also implemented in a System register interface to the Generic Timer.

*Generic Timer memory-mapped register descriptions* on page I3-5173 describes each of these registers.

**Table I1-4 CNTCTLBase memory map**

| Offset | Register | Type | Security[a] | Description |
|---|---|---|---|---|
| 0x000 | CNTFRQ[b] | RW | Secure | Counter Frequency register. |
| 0x004 | CNTNSAR | RW | Secure | Counter Non-Secure Access register. |
| 0x008 | CNTTIDR | RO | Both | Counter Timer ID register. |
| 0x00C- 0x03F | - | RES0 | - | Reserved. |
| 0x040+4*N*[c] | CNTACR<n> | RW | Configurable[d] | Counter Access Control register *N*. |
| 0x060- 0x07F | - | RES0 | - | Reserved. |
| 0x080+8*N*[c] | CNTVOFF<n>[31:0][b] | RW[e] | Configurable[d] | Virtual Offset register *N*. IMPLEMENTATION DEFINED whether this register is RW or RAZ. Optional in the CNTCTLBase memory map. |
| 0x084+8*N*[c] | CNTVOFF<n>[63:32][b] | RW[e] | | |
| 0x0C0-0x0FC | - | UNK/SBZP | - | Reserved. |
| 0x100-0x7FC | - | - | - | IMPLEMENTATION DEFINED. |
| 0x800-0xFBC | - | UNK/SBZP | - | Reserved. |
| 0xFC0-0xFCF | - | - | - | IMPLEMENTATION DEFINED. |
| 0xFD0- 0xFFC | CounterID<n> | RO | Both | Counter ID registers 0-11. |

a. Access security requirement in an implementation that supports two Security states. In an implementation that does not support multiple Security states all registers are accessible as shown in the *Type* column.

b. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers* on page D7-2276 and *Generic Timer registers* on page G6-4780. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

c. Implemented for each value of *N* from 0 to 7 for which a CNTBase*N* frame is implemented.

d. The CNTNSAR determines the Non-secure accessibility of the CNTACR<n>s and the CNTVOFF<n>s in the CNTCTLBase frame. For more information, see the register descriptions.

e. Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic Timer component does not distinguish between real time and virtual time then it can implement CNTVOFF as RAZ/WI. Otherwise CNTVOFF is a RW register, and ARM strongly recommends that the system only permits access to CNTVOFF from EL2 or higher.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I1.7 Providing a complete set of counter and timer features

Using the general model for implementing a memory-mapped interface to the Generic Timer described in this section, the feature set of a System registers counter and timer, in an implementation that includes EL2 and EL3, can be implemented using the following set of timer frames:

- A CNTCTLBase control frame.
- The following CNTBase*N* timer frames:

  **Frame 0** Accessible from Non-secure state, with second view and virtual capability. This provides the Non-secure EL1&0 timers.

  **Frame 1** Accessible from Non-secure state, with no second view and no virtual capability. This provides the Non-secure EL2 timers.

  **Frame 2** Accessible only Secure state, with a second view but no virtual capability. This provides the Secure PL1&0 timers, meaning:
  - Compared to a PE where EL3 is using AArch32, it provides the only Secure state timer.
  - Compared to a PE where EL3 is using AArch64, it provides the Secure EL1&0 timer.

  **Frame 3** Accessible only Secure state, with no second view and no virtual capability. This provides the Secure EL3 timers.

  **Note**

  This frame is not required for a memory-mapped timer that provides only the feature set of a PE for which EL3 is using AArch32.

In this implementation, the full set of implemented frames, and their configuration in the memory map, is as follows:

**CNTCTLBase**

The control frame. This frame is located in both Secure and Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is not accessible.

**CNTBase0** The first view of the Non-secure EL1&0 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is accessible only at EL1.

**CNTEL0Base0**

The second view of CNTBase0, meaning it is the EL0 view of the Non-secure EL1&0 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, the architecture permits this frame to be accessible at El1, or at EL1 and EL0, but does not require either of these options.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is accessible at EL1 and EL0.

**CNTBase1** The first and only view of the Non-secure EL2 timers. This frame is located only in Non-secure physical memory, and:
- When EL3 is using AArch64:
  - In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
  - In the Secure EL3 translation regime, this frame is accessible.
- When EL3 is using AArch32, in the Secure PL1&0 translation regime, this frame is accessible only at EL3.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is not accessible.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**CNTBase2** The first view of the Secure PL1&0 timers. This frame is located only in Secure physical memory, and:

- When EL3 is using AArch64:
  - In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
  - In the Secure EL3 translation regime, this frame is accessible.
- When EL3 is using AArch32, in the Secure PL1&0 translation regime, this frame is accessible only at EL3.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.

**CNTEL0Base2**

The second view of CNTBase2, meaning it is the EL0 view of the Secure PL1&0 timers. This frame is located only in Secure physical memory, and:

- When EL3 is using AArch64:
  - In the Secure EL1&0 translation regime, this frame is accessible at EL1 and EL0.
  - In the Secure EL3 translation regime, this frame is accessible.
- When EL3 is using AArch32, in the Secure PL1&0 translation regime, this frame is accessible at EL3 and EL0.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.

**CNTBase3** The first and only view of the Non-secure EL3 timers. This frame is located only in Secure physical memory, and:

- When EL3 is using AArch64:
  - In the Secure EL1&0 translation regime, this frame is not accessible.
  - In the Secure EL3 translation regime, this frame is accessible.
- When EL3 is using AArch32, this frame is not accessible.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.

**Note**

*About the Virtual Memory System Architecture (VMSA)* on page D4-1742 describes the VMSAv8-64 translation regimes, and *About VMSAv8-32* on page G4-3992 describes the VMSAv8-32 translation regimes.

## I1.8 Gray-count scheme for timer distribution scheme

The distribution of the Counter value using a Gray-code provides a relatively simple mechanism to avoid any danger of the count being sampled with an intermediate value even if the clocking is asynchronous. It has a further advantage that the distribution is relatively low power, since only one bit changes on the main distribution wires for each clock tick.

A suitable Gray-coding scheme can be achieved with the following logic:

Gray[N] = Count[N]

Gray[i] = (XOR(Gray[N:i+1])) XOR Count[i] for N–1 >= i >= 0

Count[i] = XOR(Gray[N:i]) for N >= i >= 0

This is for an N+1 bit counter, where Count is a conventional binary count value, and Gray is the corresponding Gray count value.

**Note**

This scheme has the advantage of being relatively simple to switch, in either direction, between operating with low-frequency and low-precision, and operating with high-frequency and high-precision. To achieve this, the ratio of the frequencies must be $2^n$, where n is an integer. A switch-over can occur only on the 2n+1 boundary to avoid losing the Gray-coding property on a switch-over.

# Chapter I2
# Recommended Memory-mapped Interfaces to the Performance Monitors

This chapter describes the recommended memory-mapped and external debug interfaces to the Performance Monitors. It contains the following section:

- *About the memory-mapped views of the Performance Monitors registers* on page I2-5112.

**Note**

*Performance Monitors memory-mapped register descriptions* on page I3-5121 describes the memory-mapped registers for the Performance Monitors.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I2.1 About the memory-mapped views of the Performance Monitors registers

An implementation can provide:

- Memory-mapped access to the Performance Monitors registers. Software running on any processor in a system can use this interface to access counters in the Performance Monitors.
- Access to the Performance Monitors registers through an external debug interface. A debugger can use this interface to access counters in the Performance Monitors.

  ARM recommends that any external debug interface is implemented as defined in the *ARM Debug Interface v5 Architecture Specification*.

  An external debug interface provides a memory-mapped view of the Performance Monitors registers.

*Performance Monitors memory-mapped registers summary* on page I3-5119 gives the memory map of these registers.

The following sections describe the memory-mapped views of the Performance Monitors registers:

- *Differences in the memory-mapped views of the Performance Monitors registers*.
- *Synchronization of changes to the memory-mapped views*.
- *Access permissions for memory-mapped views of the Performance Monitors* on page I2-5113.

In this section, unless the context explicitly indicates otherwise, any reference to *a memory-mapped view* applies equally to a register view using:

- A access through an external debug interface.
- A memory-mapped access.

### I2.1.1 Differences in the memory-mapped views of the Performance Monitors registers

A memory-mapped view of the Performance Monitors registers accesses the same registers as the System registers interface described in *Performance Monitors Extension registers* on page D5-1893, except that:

1. The PMSELR is accessible only in the System registers interface.
2. The PMCFGR, PMLAR, PMLSR, PMAUTHSTATUS, PMDEVARCH, PMDEVTYPE, PMPIDR0, PMPIDR1, PMPIDR2, PMPIDR3, PMPIDR4, PMCIDR0, PMCIDR1, PMCIDR2, and PMCIDR3 registers are accessible only in memory-mapped views. *Performance Monitors memory-mapped register descriptions* on page I3-5121 describes these registers.
3. The following controls do not affect the memory-mapped view:
   - PMSELR.
   - PMUSERENR.
   - HDCR.{TPM, TPMCR, HPMN}.

   Instead, see the register descriptions in Chapter I3 *Memory-Mapped System Control Register Descriptions*.

### I2.1.2 Synchronization of changes to the memory-mapped views

If a Performance Monitor is visible in both System register and a memory-mapped views, and is accessed simultaneously through these two mechanisms, the behavior must be as if the access occurred atomically in any order. For more information, see *Synchronization of changes to the external debug registers* on page H8-4946.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I2.1.3 Access permissions for memory-mapped views of the Performance Monitors

For more information, see *External debug interface register access permissions* on page H8-4952.

Table I2-1 shows the access permissions for the Performance Monitors registers in a v8 Debug implementation. This table uses the following terms:

**DLK** When the OS Double Lock is locked, EDPRSR.DLK == 1, accesses to some registers produce an error. Applies to both interfaces.

**EPMAD** When `AllowExternalPMUAccess()` == FALSE, external debug access is disabled. See also *Behavior of a not permitted memory-mapped access* on page H8-4951.

**Error** Indicates that the access gives an error response.

**Default** This shows the default access permissions, if none of the conditions in this list prevent access to the register.

**Off** When EDPRSR.PU == 0, the Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed.

**Note**

If debug power is off, then all external debug interface accesses return an error.

**OSLK** When the OS Lock is locked, OSLAR_EL1.OSLK == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.

**SLK** This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software lock is locked. See *Register access permissions for memory-mapped accesses* on page H8-4950.

For all other accesses, this column is ignored.

**-** Indicates that the control has no effect on the behavior of the access:

- If no other control affects the behavior, the Default access behavior applies.
- However, another control might determine the behavior.

**Table I2-1 Access permissions for the Performance Monitors registers**

| Offset | Register | Domain | Off | DLK | OSLK | EPMAD | Default | SLK |
|---|---|---|---|---|---|---|---|---|
| 0x000+8xn | PMEVCNTR<n>_EL0[a] | Core | Error | Error | Error | Error | RW | RO |
| 0x0F8 | PMCCNTR_EL0[31:0] | Core | Error | Error | Error | Error | RW | RO |
| 0x0FC | PMCCNTR_EL0[63:32] | Core | Error | Error | Error | Error | RW | RO |
| 0x400+4xn | PMEVTYPER<n>_EL0[a] | Core | Error | Error | Error | Error | RW | RO |
| 0x47C | PMCCFILTR_EL0 | Core | Error | Error | Error | Error | RW | RO |
| 0x600-0x6FC | - | - | Access is IMPLEMENTATION DEFINED | | | | | |

**Table I2-1 Access permissions for the Performance Monitors registers (continued)**

| Offset | Register | Domain | Off | DLK | OSLK | EPMAD | Default | SLK |
|---|---|---|---|---|---|---|---|---|
| 0xCA0 | PMSWINC_EL0[b] | Core | Error | Error | Error | Error | WO | WI |
| 0xCC0 | PMOVSSET_EL0 | Core | Error | Error | Error | Error | RW | RO |
| 0xD80-0xDFC | - | - | Access is IMPLEMENTATION DEFINED | | | | | |
| 0xE00 | PMCFGR | Core | Error | Error | Error | Error | RO | RO |
| 0xE04 | PMCR_EL0 | Core | Error | Error | Error | Error | RW | RO |
| 0xE20 | PMCEID0_EL0 | Core | Error | Error | Error | Error | RO | RO |
| 0xE24 | PMCEID1_EL0 | Core | Error | Error | Error | Error | RO | RO |
| 0xE80-0xEFC | Integration registers | - | Access is IMPLEMENTATION DEFINED | | | | | |
| 0xF00-0xFFC | *Management registers and CoreSight compliance* on page K2-5523 | | | | | | | |

a. Implemented counters only. *n* is the counter number.
b. Only if the OPTIONAL PMSWINC_EL0 register is implemented in the external debug interface.

### I2.1.4 Power domains and Performance Monitors registers reset

For ARMv8-A implementations, ARM recommends that Performance Monitors are implemented as part of the core power domain, not as part of a separate debug power domain. There is no interface to access the Performance Monitors registers when the core power domain is powered down.

A Warm or Cold reset sets the Performance Monitors registers to their reset values. An External Debug reset does not change the values of the Performance Monitors registers.

For more information about the reset scheme recommended for a v8 Debug implementation see Chapter H6 *Debug Reset and Powerdown Support*.

Table I2-2 on page I2-5115 shows the Performance Monitors register resets for writable register fields. The column headings use the following terms:

**64** This is the architectural reset value when resetting into AArch64 state.

**32** This is the architectural reset value when resetting into AArch32 state.

**-** This indicates an IMPLEMENTATION DEFINED reset value on the specified reset. This might be UNKNOWN.

**Note**

This table does not include:

- Read-only identification registers and fields that have a fixed value. In this case, the reset value is that fixed value. An example of this is PMCR_EL0.N.
- Write-only registers and fields that only have an effect on writes. These do not have a reset value. An example of this is PMSWINC_EL0.
- IMPLEMENTATION DEFINED registers. In this case, the reset domains are IMPLEMENTATION DEFINED. The reset values are IMPLEMENTATION DEFINED and might be UNKNOWN.

# Chapter I3
# Memory-Mapped System Control Register Descriptions

This chapter describes the memory-mapped system control registers. It contains the following sections:

- *About the memory-mapped system control register descriptions* on page I3-5118.
- *Performance Monitors memory-mapped registers summary* on page I3-5119.
- *Performance Monitors memory-mapped register descriptions* on page I3-5121.
- *Generic Timer memory-mapped registers overview* on page I3-5172.
- *Generic Timer memory-mapped register descriptions* on page I3-5173.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## I3.1 About the memory-mapped system control register descriptions

This chapter describes the memory-mapped system control registers other than the memory-mapped debug registers. That is, it describes:

**The memory-mapped view of the Performance Monitors registers**

- *Performance Monitors memory-mapped registers summary* on page I3-5119 lists these registers and describes their memory map.
- *Performance Monitors memory-mapped register descriptions* on page I3-5121 describes each of the memory-mapped registers.

Chapter I2 *Recommended Memory-mapped Interfaces to the Performance Monitors* describes the recommended interface to these registers.

**Note**

Chapter D5 *The Performance Monitors Extension* describes the Performance Monitors. The following sections describe the System register interfaces to the Performance Monitors:

- *Performance Monitors registers* on page D7-2236, for accesses from an Exception level that is using AArch64.
- *Performance Monitors registers* on page G6-4737, for accesses from an Exception level that is using AArch32.

**The registers for the system-level Generic Timer component**

Any implementation that includes the Generic Timer must include the memory-mapped system-level component described in Chapter I1 *System Level Implementation of the Generic Timer*. In this chapter:

- *Generic Timer memory-mapped registers overview* on page I3-5172 gives an overview of the registers, referring to Chapter I1 for more information.
- *Generic Timer memory-mapped register descriptions* on page I3-5173 describes each of the memory-mapped registers.

**Note**

Chapter D6 *The Generic Timer in AArch64 state* describes the Generic Timer component that is accessible using the System registers. The following sections describe the System register interfaces to that component:

- *Generic Timer registers* on page D7-2276, for accesses from an Exception level that is using AArch64.
- *Generic Timer registers* on page G6-4780, for accesses from an Exception level that is using AArch32.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I3.2 Performance Monitors memory-mapped registers summary

The locations of the registers in the memory-mapped view of the Performance Monitors are defined as offsets from a system-defined base address. *Performance Monitors memory-mapped register views* defines this memory map.

### I3.2.1 Performance Monitors memory-mapped register views

Table I3-1 shows the memory-mapped view of the Performance Monitors registers. All other entries are reserved.

**Note**

- Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any memory-mapped view.
- The registers that relate to an implemented event counter, PMN*x*, are PMEVCNTR<n> and PMEVTYPER<n>.
- The mapping of the *Performance Monitors Event Counter Registers*, at offsets `0x000-0x0F4`, has changed compared to the mappings of the equivalent registers in ARMv7.

Each entry in the Name column links to the register description in *Performance Monitors memory-mapped register descriptions* on page I3-5121, and:

- If the *System register?* column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
  - *Performance Monitors registers* on page D7-2236, for the AArch64 System register
  - *Performance Monitors registers* on page G6-4737, for the AArch32 System register
- Otherwise, the register is accessible only using the memory-mapped interface.

**Table I3-1 Performance Monitors memory-mapped register views**

| Offset | Type | Name | Description | System register? |
|---|---|---|---|---|
| `0x000`+8n | RW | PMEVCNTR<n>_EL0 | Performance Monitors Event Counter Register. | Yes |
| `0x0F8`<br>`0x0FC` | RW | PMCCNTR_EL0[31:0]<br>PMCCNTR_EL0[63:32] | Performance Monitors Cycle Counter Register[a] | Yes |
| `0x400`+4n | RW | PMEVTYPER<n>_EL0 | Performance Monitors Event Type and Filter Register. | Yes |

| 0xFE0 | RO | PMPIDR0[b] | | |
| 0xFE4 | RO | PMPIDR1[b] | | |
| 0xFE8 | RO | PMPIDR2[b] | | |
| 0xFEC | RO | PMPIDR3[b] | | |
| 0xFF0 | RO | PMCIDR0[b] | Component ID registers | No |
| 0xFF4 | RO | PMCIDR1[b] | | |
| 0xFF8 | RO | PMCIDR2[b] | | |
| 0xFFC | RO | PMCIDR3[b] | | |

a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.

b. CoreSight interface registers, see *Management registers and CoreSight compliance* on page K2-5523.

c. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

*Non-Confidential - Beta*

## I3.3 Performance Monitors memory-mapped register descriptions

This section describes the Performance Monitoring registers. *Performance Monitors memory-mapped registers summary* on page I3-5119 lists these registers in their memory map.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### I3.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

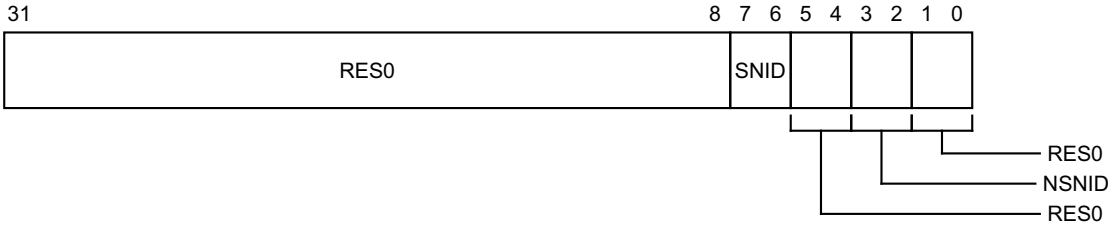
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMAUTHSTATUS is in the Debug power domain.



This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.

**Attributes**

PMAUTHSTATUS is a 32-bit register.

## Field descriptions

The PMAUTHSTATUS bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

**Bits [5:4]**

Reserved, RES0.

**NSNID, bits [3:2]**

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

**Bits [1:0]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMAUTHSTATUS:

PMAUTHSTATUS can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xFB8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Usage constraints**

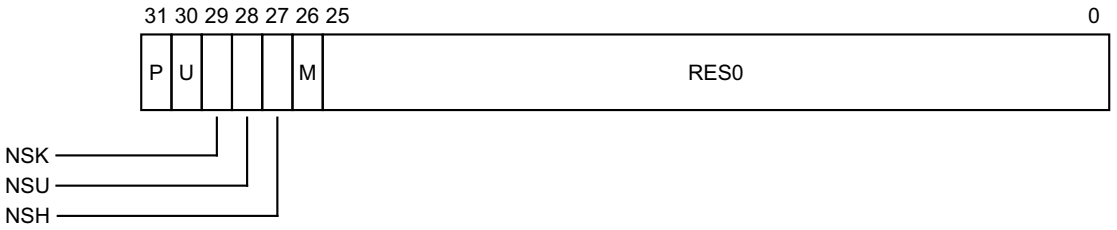
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMCCFILTR_EL0 is architecturally mapped to AArch64 System register PMCCFILTR_EL0.

External register PMCCFILTR_EL0 is architecturally mapped to AArch32 System register PMCCFILTR.



PMCCFILTR_EL0 is in the Core power domain.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

## Field descriptions

The PMCCFILTR_EL0 bit assignments are:

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

`0` Count cycles in EL1.

`1` Do not count cycles in EL1.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

`0` Count cycles in EL0.

`1` Do not count cycles in EL0.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Otherwise, cycles in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

`0` Do not count cycles in EL2.

`1` Count cycles in EL2.

**M, bit [26]**

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

**Bits [25:0]**

Reserved, RES0.

### Accessing the PMCCFILTR_EL0:

PMCCFILTR_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0x47C |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D5-1858 for more information.

**Usage constraints**

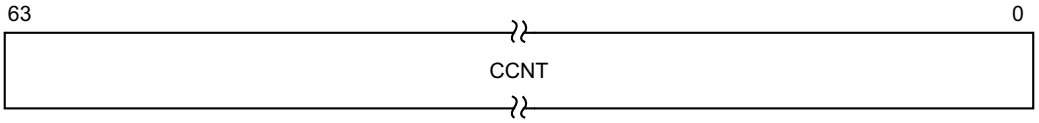
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMCCNTR_EL0 is architecturally mapped to AArch64 System register PMCCNTR_EL0.

External register PMCCNTR_EL0 is architecturally mapped to AArch32 System register PMCCNTR.



PMCCNTR_EL0 is in the Core power domain.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

#### Field descriptions

The PMCCNTR_EL0 bit assignments are:

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

#### Accessing the PMCCNTR_EL0:

PMCCNTR_EL0[31:0] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0x0F8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

PMCCNTR_EL0[63:32] can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0x0FC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.4 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

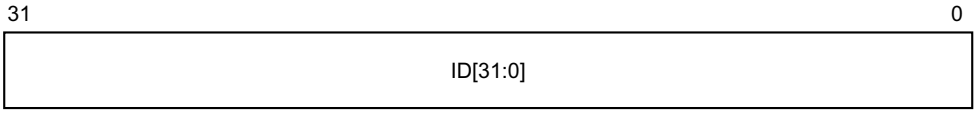
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RO |

**Configurations**

External register PMCEID0_EL0 is architecturally mapped to AArch64 System register PMCEID0_EL0.

External register PMCEID0_EL0 is architecturally mapped to AArch32 System register PMCEID0.



PMCEID0_EL0 is in the Core power domain.

**Attributes**

PMCEID0_EL0 is a 32-bit register.

#### Field descriptions

The PMCEID0_EL0 bit assignments are:

**ID[31:0], bits [31:0]**

PMCEID0_EL0[n] maps to event n. For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1872.

For each bit:

`0` The common event is not implemented.

`1` The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

#### Accessing the PMCEID0_EL0:

PMCEID0_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xE20` |

### I3.3.5 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

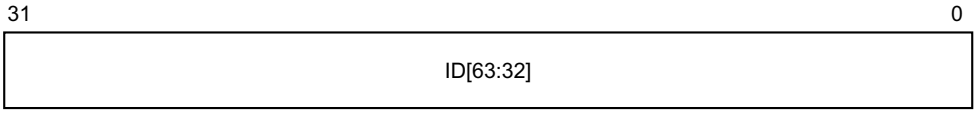
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RO |

**Configurations**

External register PMCEID1_EL0 is architecturally mapped to AArch64 System register PMCEID1_EL0.

External register PMCEID1_EL0 is architecturally mapped to AArch32 System register PMCEID1.



PMCEID1_EL0 is in the Core power domain.

**Attributes**

PMCEID1_EL0 is a 32-bit register.

#### Field descriptions

The PMCEID1_EL0 bit assignments are:

**ID[63:32], bits [31:0]**

PMCEID1_EL0[n] maps to event (n + 32). For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1872.

For each bit:

`0` The common event is not implemented.

`1` The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

#### Accessing the PMCEID1_EL0:

PMCEID1_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xE24` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.6 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

**Purpose**

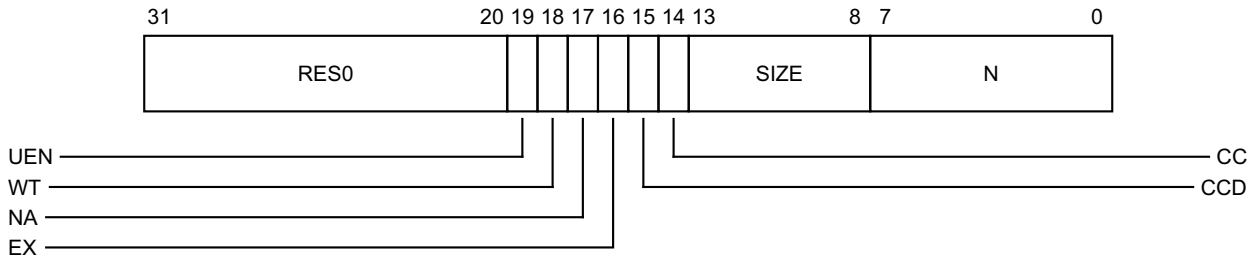
Contains PMU-specific configuration data.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RO |

**Configurations**



PMCFGR is in the Core power domain.

**Attributes**

PMCFGR is a 32-bit register.

## Field descriptions

The PMCFGR bit assignments are:

**Bits [31:20]**

Reserved, RES0.

**UEN, bit [19]**

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RES0.

**WT, bit [18]**

This feature is not supported, so this bit is RES0.

**NA, bit [17]**

This feature is not supported, so this bit is RES0.

**EX, bit [16]**

Export supported. Value is IMPLEMENTATION DEFINED.

`0` PMCR_EL0.X is RES0.

`1` PMCR_EL0.X is read/write.

**CCD, bit [15]**

Cycle counter has prescale. This is RES1 if AArch32 is supported at any EL, and RES0 otherwise.

`0` PMCR_EL0.D is RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 PMCR_EL0.D is read/write.

**CC, bit [14]**

Dedicated cycle counter (counter 31) supported. This bit is RES1.

**SIZE, bits [13:8]**

Size of counters. This field determines the spacing of counters in the memory-map.

In ARMv8 the counters are at doubleword-aligned addresses, and the largest counter is 64-bits, so this field is `0b111111`.

**N, bits [7:0]**

Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31, so bits[7:5] are always RES0.

`00000000` Only PMCCNTR_EL0 implemented.

`00000001` PMCCNTR_EL0 plus one event counter implemented.

and so on up to `00011111`, which indicates PMCCNTR_EL0 and 31 event counters implemented.

## Accessing the PMCFGR:

PMCFGR can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xE00` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.7 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

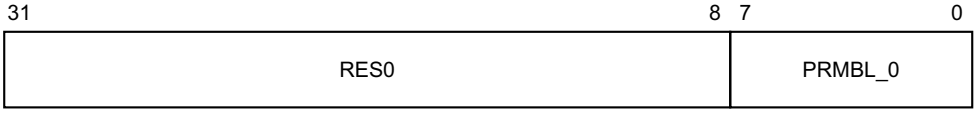
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMCIDR0 is in the Debug power domain.

PMCIDR0 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

#### Field descriptions

The PMCIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as `0x0D`.

#### Accessing the PMCIDR0:

PMCIDR0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFF0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.8 PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

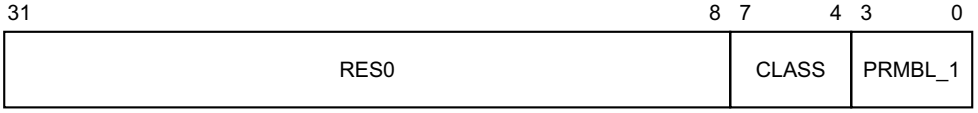
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMCIDR1 is in the Debug power domain.

PMCIDR1 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMCIDR1 is a 32-bit register.

#### Field descriptions

The PMCIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as `0x9`, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

#### Accessing the PMCIDR1:

PMCIDR1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFF4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.9 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

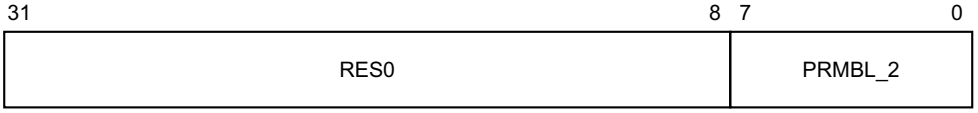
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMCIDR2 is in the Debug power domain.

PMCIDR2 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

#### Field descriptions

The PMCIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as `0x05`.

#### Accessing the PMCIDR2:

PMCIDR2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFF8` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.10 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

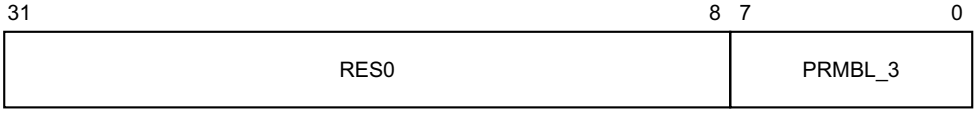
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMCIDR3 is in the Debug power domain.

PMCIDR3 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMCIDR3 is a 32-bit register.

#### Field descriptions

The PMCIDR3 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as `0xB1`.

#### Accessing the PMCIDR3:

PMCIDR3 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFFC` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.11 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**

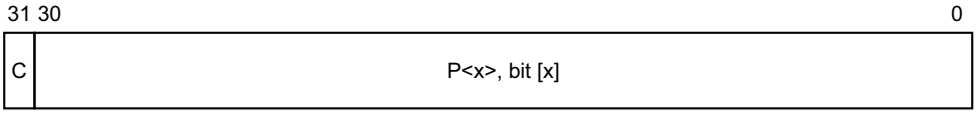
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMCNTENCLR_EL0 is architecturally mapped to AArch64 System register PMCNTENCLR_EL0.

External register PMCNTENCLR_EL0 is architecturally mapped to AArch32 System register PMCNTENCLR.



PMCNTENCLR_EL0 is in the Core power domain.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

## Field descriptions

The PMCNTENCLR_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

0 When read, means the cycle counter is disabled. When written, has no effect.

1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**

Event counter disable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

Possible values of each bit are:

0 When read, means that PMEVCNTR<x> is disabled. When written, has no effect.

1 When read, means that PMEVCNTR<x> is enabled. When written, disables PMEVCNTR<x>.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMCNTENCLR_EL0:

PMCNTENCLR_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xC20 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.12 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**

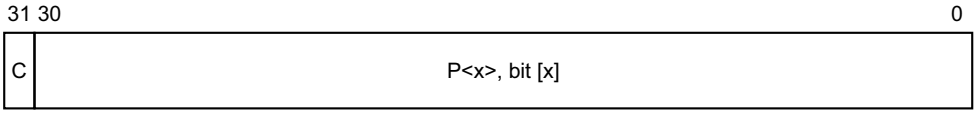
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMCNTENSET_EL0 is architecturally mapped to AArch64 System register PMCNTENSET_EL0.

External register PMCNTENSET_EL0 is architecturally mapped to AArch32 System register PMCNTENSET.



PMCNTENSET_EL0 is in the Core power domain.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

#### Field descriptions

The PMCNTENSET_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

0 When read, means the cycle counter is disabled. When written, has no effect.

1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**

Event counter enable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

Possible values of each bit are:

0 When read, means that PMEVCNTR<x> is disabled. When written, has no effect.

1 When read, means that PMEVCNTR<x> event counter is enabled. When written, enables PMEVCNTR<x>.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMCNTENSET_EL0:

PMCNTENSET_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xC00 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.13 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Usage constraints**

This register is accessible as follows:

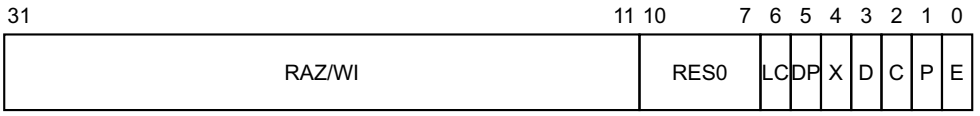
| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMCR_EL0[6:0] is architecturally mapped to AArch32 System register PMCR[6:0].

External register PMCR_EL0[6:0] is architecturally mapped to AArch64 System register PMCR_EL0[6:0].

PMCR_EL0 is in the Core power domain.



This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

**Attributes**

PMCR_EL0 is a 32-bit register.

## Field descriptions

The PMCR_EL0 bit assignments are:

**Bits [31:11]**

Reserved, RAZ/WI.

**Bits [10:7]**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines which PMCCNTR_EL0 bit generates an overflow recorded by PMOVSR[31].

`0` Cycle counter overflow on increment that changes PMCCNTR_EL0[31] from 1 to 0.

`1` Cycle counter overflow on increment that changes PMCCNTR_EL0[63] from 1 to 0.

ARM deprecates use of PMCR_EL0.LC = 0.

In an AArch64-only implementation, this field is RES1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**DP, bit [5]**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

0 PMCCNTR_EL0, if enabled, counts when event counting is prohibited.

1 PMCCNTR_EL0 does not count when event counting is prohibited.

Event counting is prohibited when ProfilingProhibited(IsSecure(),PSTATE.EL) == TRUE.

This bit is RW.

If EL3 is not implemented, this field is RES0.

**X, bit [4]**

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

0 Do not export events.

1 Export events where not prohibited.

This bit is used to permit events to be exported to another debug device, such as an OPTIONAL trace macrocell, over an event bus. If the implementation does not include such an event bus, this bit is RAZ/WI.

This bit does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If the implementation does not include an exported event stream, this bit is RAZ/WI. Otherwise this bit is RW.

**D, bit [3]**

Clock divider. The possible values of this bit are:

0 When enabled, PMCCNTR_EL0 counts every clock cycle.

1 When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

This bit is RW.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of PMCR.D = 1.

In an AArch64-only implementation, this field is RES0.

**C, bit [2]**

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

0 No action.

1 Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.

Resetting PMCCNTR_EL0 does not clear the PMCCNTR_EL0 overflow bit to 0.

**P, bit [1]**

Event counter reset. This bit is WO. The effects of writing to this bit are:

0 No action.

1 Reset all event counters, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

Resetting the event counters does not clear any overflow bits to 0.

**E, bit [0]**

Enable. The possible values of this bit are:

0 All counters, including PMCCNTR_EL0, are disabled.

1 All counters are enabled by PMCNTENSET_EL0.

This bit is RW.

Non-Confidential - Beta

### Accessing the PMCR_EL0:

PMCR_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xE04 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.14 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

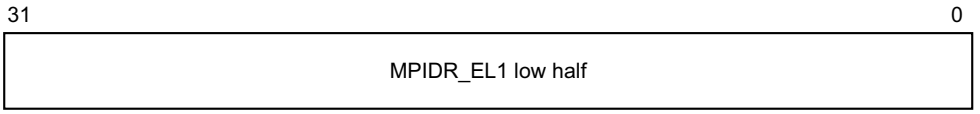
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMDEVAFF0 is in the Debug power domain.



PMDEVAFF0 is optional to implement in the external register interface.

**Attributes**

PMDEVAFF0 is a 32-bit register.

#### Field descriptions

The PMDEVAFF0 bit assignments are:

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

#### Accessing the PMDEVAFF0:

PMDEVAFF0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xFA8 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.15 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

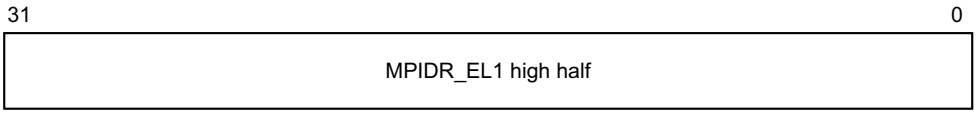
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMDEVAFF1 is in the Debug power domain.



PMDEVAFF1 is optional to implement in the external register interface.

**Attributes**

PMDEVAFF1 is a 32-bit register.

#### Field descriptions

The PMDEVAFF1 bit assignments are:

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

#### Accessing the PMDEVAFF1:

PMDEVAFF1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xFAC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.16 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the Performance Monitor component.

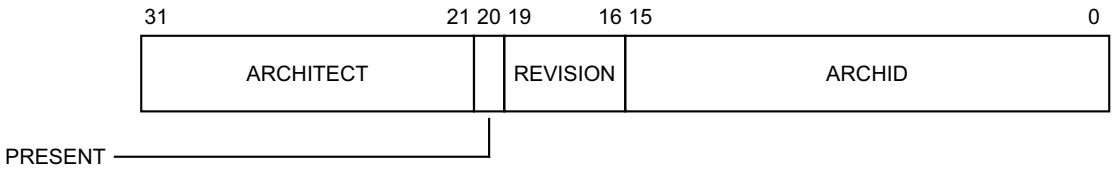
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMDEVARCH is in the Debug power domain.



PMDEVARCH is optional to implement in the external register interface.

**Attributes**

PMDEVARCH is a 32-bit register.

#### Field descriptions

The PMDEVARCH bit assignments are:

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For Performance Monitors, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, `0x4`.

Bits [27:21] are the JEP 106 ID code, `0x3B`.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For Performance Monitors, the revision defined by ARMv8 is `0x0`.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, `0x2`.
- Bits [11:0] are the architecture part number, `0xA16`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This corresponds to Performance Monitors architecture version PMUv3.

**Note**

The PMUv3 memory-mapped programmers' model can be used by devices other than ARMv8 processors. Software must determine whether the PMU is attached to an ARMv8 processor by using the PMDEVAFF0 and PMDEVAFF1 registers to discover the affinity of the PMU to any ARMv8 processors.

### Accessing the PMDEVARCH:

PMDEVARCH can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xFBC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.17 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs performance monitor interface.

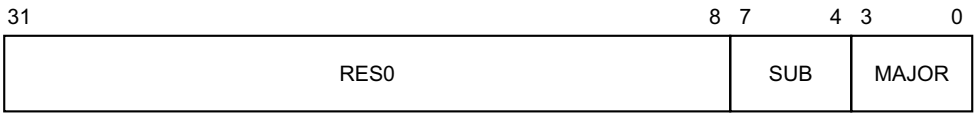
**Usage constraints**

This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMDEVTYPE is in the Debug power domain.



PMDEVTYPE is optional to implement in the external register interface.

**Attributes**

PMDEVTYPE is a 32-bit register.

#### Field descriptions

The PMDEVTYPE bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as `0x1` to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as `0x6` to indicate this is a performance monitor component.

#### Accessing the PMDEVTYPE:

PMDEVTYPE can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFCC` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.18 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Usage constraints**

This register is accessible as follows:

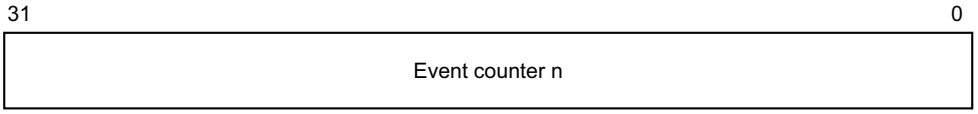
| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2.{TPM, TPMCR, HPMN} and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current EL or privilege of the access.

**Configurations**

External register PMEVCNTR<n>_EL0 is architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0.

External register PMEVCNTR<n>_EL0 is architecturally mapped to AArch32 System register PMEVCNTR<n>.



PMEVCNTR<n>_EL0 is in the Core power domain.

**Attributes**

PMEVCNTR<n>_EL0 is a 32-bit register.

#### Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

#### Accessing the PMEVCNTR<n>_EL0:

PMEVCNTR<n>_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0x000` + 8n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.19 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Usage constraints**

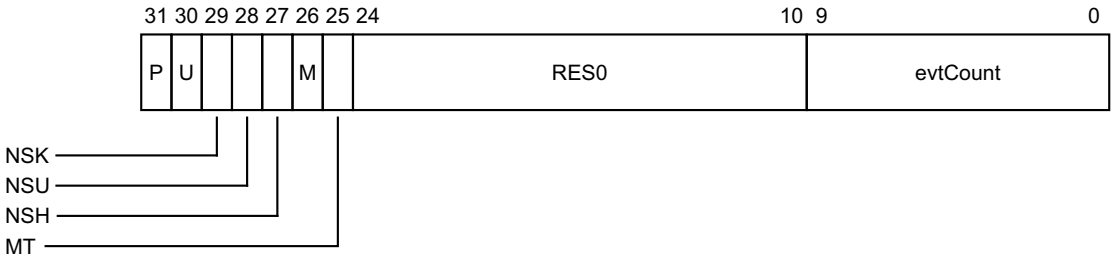
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMEVTYPER<n>_EL0 is architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0.

External register PMEVTYPER<n>_EL0 is architecturally mapped to AArch32 System register PMEVTYPER<n>.



PMEVTYPER<n>_EL0 is in the Core power domain.

**Attributes**

PMEVTYPER<n>_EL0 is a 32-bit register.

## Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

`0` Count events in EL1.

`1` Do not count events in EL1.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

`0` Count events in EL0.

`1` Do not count events in EL0.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

`0` Do not count events in EL2.

`1` Count events in EL2.

**M, bit [26]**

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Secure EL3 are counted.

Otherwise, events in Secure EL3 are not counted.

**MT, bit [25]**

Multi-threading. If MPIDR_EL1.MT is set to 0, this bit is RES0. Otherwise valid values for this bit are:

`0` Count events only on controlling PE.

`1` Count events from any PE with the same affinity at level 1 and above as this PE.

**Note**

Events from a different thread of a multi-threaded implementation are not Attributable to the thread counting the event.

**Bits [24:10]**

Reserved, RES0.

**evtCount, bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event defined by the processor or a common event defined by the architecture.

If evtCount is programmed to an event that is reserved or not implemented, the behavior depends on the event type.

For common architectural and microarchitectural events:

- No events are counted.
- The value read back on evtCount is the value written.

For IMPLEMENTATION DEFINED events:

- It is UNPREDICTABLE what event, if any, is counted. UNPREDICTABLE in this case means the event must not expose privileged information.
- The value read back on evtCount is an UNKNOWN value with the same effect.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMEVTYPER<n>_EL0:

PMEVTYPER<n>_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0x400 + 4n |

### I3.3.20 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

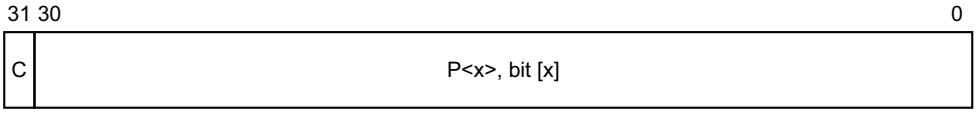
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMINTENCLR_EL1 is architecturally mapped to AArch64 System register PMINTENCLR_EL1.

External register PMINTENCLR_EL1 is architecturally mapped to AArch32 System register PMINTENCLR.



PMINTENCLR_EL1 is in the Core power domain.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

## Field descriptions

The PMINTENCLR_EL1 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

`0` When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

`1` When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<x>_EL0.

N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values are:

`0` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is disabled. When written, has no effect.

`1` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<x>_EL0 interrupt request.

### Accessing the PMINTENCLR_EL1:

PMINTENCLR_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xC60 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.21 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

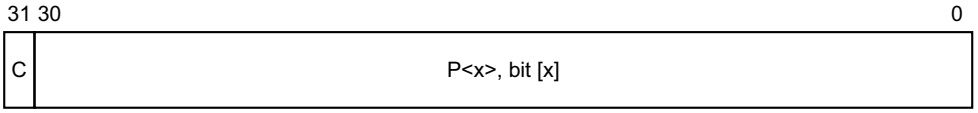
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMINTENSET_EL1 is architecturally mapped to AArch64 System register PMINTENSET_EL1.

External register PMINTENSET_EL1 is architecturally mapped to AArch32 System register PMINTENSET.



PMINTENSET_EL1 is in the Core power domain.

**Attributes**

PMINTENSET_EL1 is a 32-bit register.

## Field descriptions

The PMINTENSET_EL1 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

`0` When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

`1` When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow interrupt request enable bit for PMEVCNTR<x>_EL0.

N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values are:

`0` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is disabled. When written, has no effect.

`1` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<x>_EL0 interrupt request.

### Accessing the PMINTENSET_EL1:

PMINTENSET_EL1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xC40 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.22 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

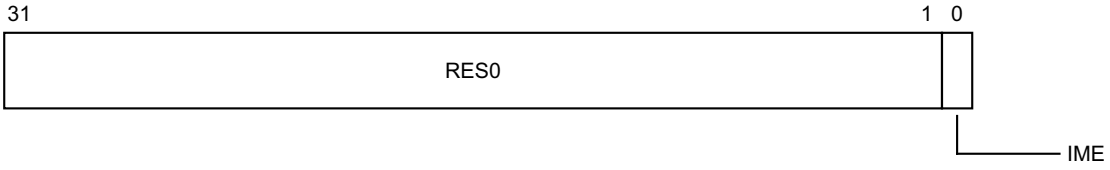
**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | Default |
|---|---|---|---|
| IMP DEF | IMP DEF | IMP DEF | RW |

**Configurations**

It is IMPLEMENTATION DEFINED whether PMITCTRL is in the Core power domain or in the Debug power domain.



PMITCTRL is optional to implement in the external register interface.

**Attributes**

PMITCTRL is a 32-bit register.

## Field descriptions

The PMITCTRL bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

`0` Normal operation.

`1` Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMITCTRL:

PMITCTRL can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xF00 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.23 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

**Purpose**

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| WO |

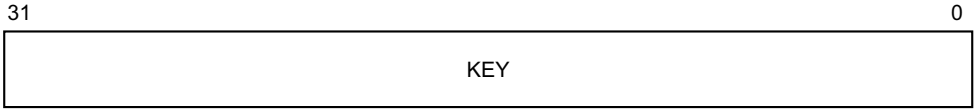
**Configurations**

PMLAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

PMLAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.



Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLAR is a 32-bit register.

#### Field descriptions

The PMLAR bit assignments are:

**KEY, bits [31:0]**

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

#### Accessing the PMLAR:

PMLAR can be accessed through the memory-mapped interface:

| Component | Offset |
|---|---|
| PMU | `0xFB0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.24 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for Performance Monitors registers.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

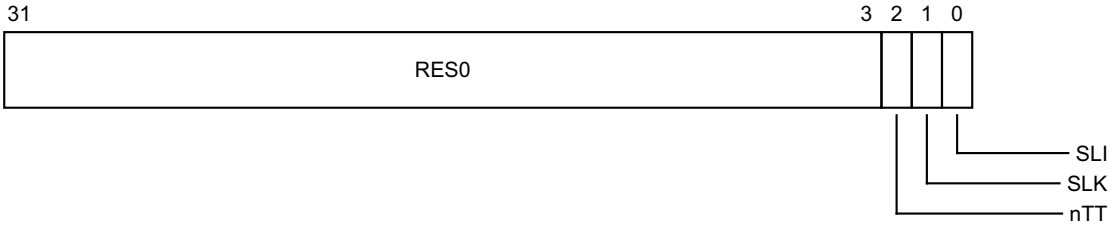
**Configurations**

PMLSR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

PMLSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.



Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLSR is a 32-bit register.

#### Field descriptions

The PMLSR bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

`0` Lock clear. Writes are permitted to this component's registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on External debug reset.

**SLI, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

0 Software lock not implemented or not memory-mapped access.

1 Software lock implemented and memory-mapped access.

### Accessing the PMLSR:

PMLSR can be accessed through the memory-mapped interface:

| Component | Offset |
|---|---|
| PMU | 0xFB4 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.25 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>. Writing to this register clears these bits.

**Usage constraints**

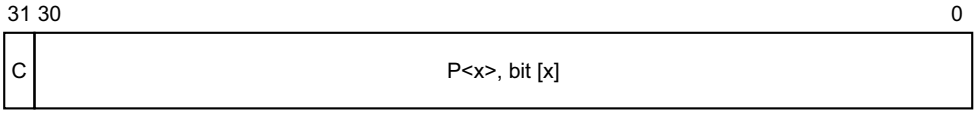
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMOVSCLR_EL0 is architecturally mapped to AArch64 System register PMOVSCLR_EL0.

External register PMOVSCLR_EL0 is architecturally mapped to AArch32 System register PMOVSR.



PMOVSCLR_EL0 is in the Core power domain.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

## Field descriptions

The PMOVSCLR_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow bit. Possible values are:

`0` When read, means the cycle counter has not overflowed. When written, has no effect.

`1` When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR_EL0.LC is used to control from which bit of PMCCNTR_EL0 (bit 31 or bit 63) an overflow is detected.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow clear bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

Possible values of each bit are:

`0` When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

`1` When read, means that PMEVCNTR<x> has overflowed. When written, clears the PMEVCNTR<x> overflow bit to 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMOVSCLR_EL0:

PMOVSCLR_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xC80 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.26 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>.

**Usage constraints**

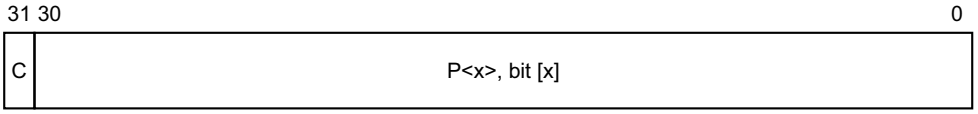
This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | RO | RW |

**Configurations**

External register PMOVSSET_EL0 is architecturally mapped to AArch64 System register PMOVSSET_EL0.

External register PMOVSSET_EL0 is architecturally mapped to AArch32 System register PMOVSSET.



PMOVSSET_EL0 is in the Core power domain.

**Attributes**

PMOVSSET_EL0 is a 32-bit register.

## Field descriptions

The PMOVSSET_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow bit. Possible values are:

`0` When read, means the cycle counter has not overflowed. When written, has no effect.

`1` When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow set bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

Possible values are:

`0` When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

`1` When read, means that PMEVCNTR<x> has overflowed. When written, sets the PMEVCNTR<x> overflow bit to 1.

Non-Confidential - Beta

### Accessing the PMOVSSET_EL0:

PMOVSSET_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xCC0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.27 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

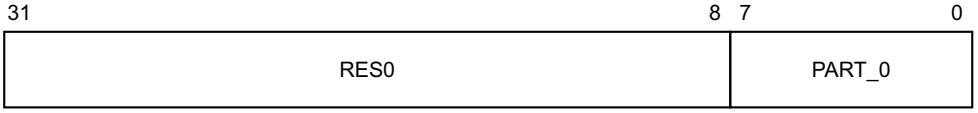
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMPIDR0 is in the Debug power domain.

PMPIDR0 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMPIDR0 is a 32-bit register.

#### Field descriptions

The PMPIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

#### Accessing the PMPIDR0:

PMPIDR0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xFE0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.28 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

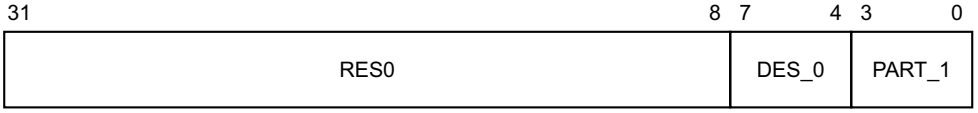
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMPIDR1 is in the Debug power domain.

PMPIDR1 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMPIDR1 is a 32-bit register.

#### Field descriptions

The PMPIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is `0b1011`.

**PART_1, bits [3:0]**

Part number, most significant nibble.

#### Accessing the PMPIDR1:

PMPIDR1 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFE4` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.29 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

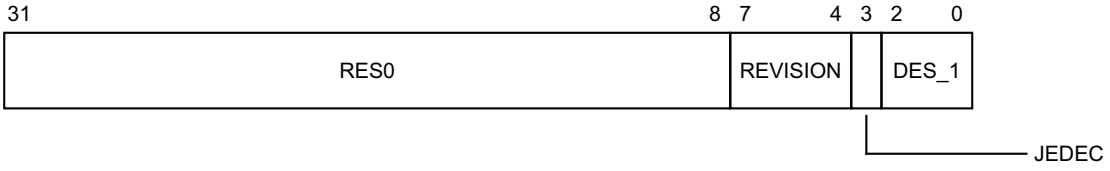
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMPIDR2 is in the Debug power domain.

PMPIDR2 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMPIDR2 is a 32-bit register.

#### Field descriptions

The PMPIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is `0b011`.

#### Accessing the PMPIDR2:

PMPIDR2 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFE8` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.30 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

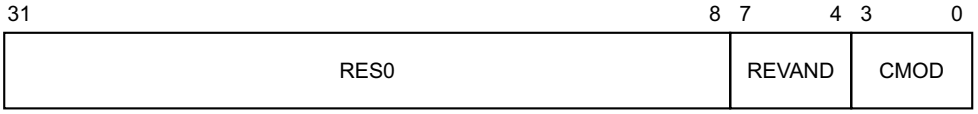
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMPIDR3 is in the Debug power domain.

PMPIDR3 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMPIDR3 is a 32-bit register.

#### Field descriptions

The PMPIDR3 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

#### Accessing the PMPIDR3:

PMPIDR3 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xFEC |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.31 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

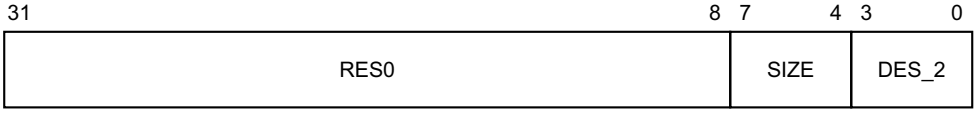
This register is accessible as follows:

| SLK | Default |
|---|---|
| RO | RO |

**Configurations**

PMPIDR4 is in the Debug power domain.

PMPIDR4 is optional to implement in the external register interface.



This register is required for CoreSight compliance.

**Attributes**

PMPIDR4 is a 32-bit register.

#### Field descriptions

The PMPIDR4 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. $Log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is `0b0100`.

#### Accessing the PMPIDR4:

PMPIDR4 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | `0xFD0` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.3.32 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event `0x00`.

**Usage constraints**

This register is accessible as follows:

| Off | DLK | OSLK | EPMAD | SLK | Default |
|---|---|---|---|---|---|
| Error | Error | Error | Error | WI | WO |

**Configurations**

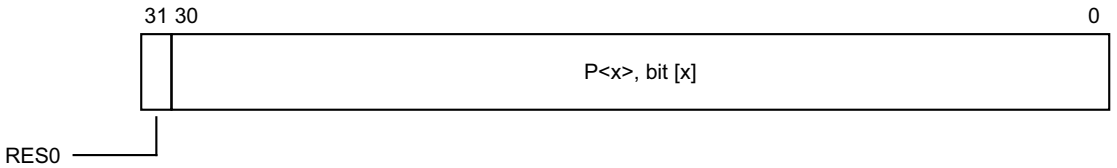
External register PMSWINC_EL0 is architecturally mapped to AArch64 System register PMSWINC_EL0.

External register PMSWINC_EL0 is architecturally mapped to AArch32 System register PMSWINC.

PMSWINC_EL0 is in the Core power domain.

PMSWINC_EL0 is optional to implement in the external register interface.

If this register is implemented, use of it is deprecated.



If 1 is written to bit [x] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter x. This is consistent with not implementing the register in the external debug interface.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

## Field descriptions

The PMSWINC_EL0 bit assignments are:

**Bit [31]**

Reserved, RES0.

**P<x>, bit [x], for x = 0 to 30**

Event counter software increment bit for PMEVCNTR<x>.

P<x> is WI if x >= PMCR_EL0.N, the number of implemented counters.

Otherwise, the effects of writing to this bit are:

`0` No action. The write to this bit is ignored.

`1` It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter x.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the PMSWINC_EL0:

PMSWINC_EL0 can be accessed through the memory-mapped interface and the external debug interface:

| Component | Offset |
|---|---|
| PMU | 0xCA0 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I3.4 Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBase*N* register frames, each with its own base address CNTBase*N*.
- For each CNTBase*N* register frame, if required, a CNTEL0Base*N* register frame, at base address CNTEL0Base*N*, that provides an EL0 view of the CNTBase*N* register frame.

For more information, see:

- *Memory-mapped timer components* on page I1-5104.
- *The CNTBaseN and CNTEL0BaseN frames* on page I1-5105. This section includes the memory map of the CNTBase*N* and CNTBase*N* register frames.
- *The CNTCTLBase frame* on page I1-5107. This section includes the memory map of the CNTCTLBase register frame.
- *Providing a complete set of counter and timer features* on page I1-5108.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## I3.5 Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. *Generic Timer memory-mapped registers overview* on page I3-5172 gives an overview of these registers, and includes links to their memory maps.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible from Non-secure state.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RW |

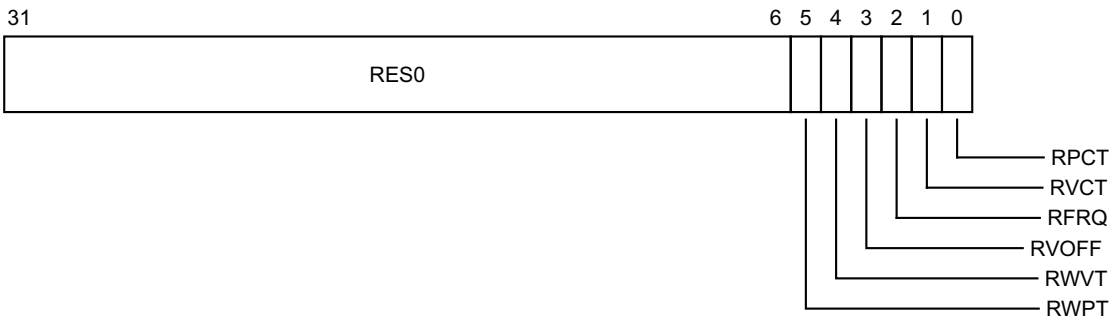
In a system that implements both Secure and Non-secure states:

- CNTACR<n> is always accessible in Secure state.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible in Non-secure state.

**Configurations**

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:



- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR<n> is a 32-bit register.

#### Field descriptions

The CNTACR<n> bit assignments are:

**Bits [31:6]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**RWPT, bit [5]**

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>. The possible values of this bit are:

`0` No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.

`1` Read/write access to the EL1 Physical Timer registers in frame <n>.

**RWVT, bit [4]**

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>. The possible values of this bit are:

`0` No access to the Virtual Timer registers in frame <n>. The registers are RES0.

`1` Read/write access to the Virtual Timer registers in frame <n>.

**RVOFF, bit [3]**

Read-only access to CNTVOFF, in frame <n>. The possible values of this bit are:

`0` No access to CNTVOFF in frame <n>. The register is RES0.

`1` Read-only access to CNTVOFF in frame <n>.

**RFRQ, bit [2]**

Read-only access to CNTFRQ, in frame <n>. The possible values of this bit are:

`0` No access to CNTFRQ in frame <n>. The register is RES0.

`1` Read-only access to CNTFRQ in frame <n>.

**RVCT, bit [1]**

Read-only access to CNTVCT, in frame <n>. The possible values of this bit are:

`0` No access to CNTVCT in frame <n>. The register is RES0.

`1` Read-only access to CNTVCT in frame <n>.

**RPCT, bit [0]**

Read-only access to CNTPCT, in frame <n>. The possible values of this bit are:

`0` No access to CNTPCT in frame <n>. The register is RES0.

`1` Read-only access to CNTPCT in frame <n>.

### Accessing the CNTACR<n>:

CNTACR<n> can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTCTLBase | `0x040` + 4n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

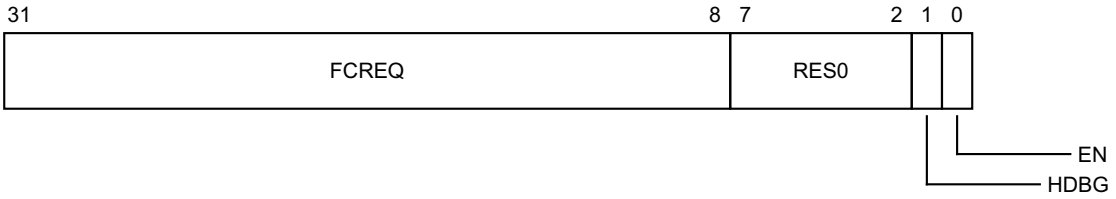
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RW |

In a system that implements both Secure and Non-secure states, this register is only writable in Secure state.

**Configurations**



There are no configuration notes.

**Attributes**

CNTCR is a 32-bit register.

## Field descriptions

The CNTCR bit assignments are:

**FCREQ, bits [31:8]**

Frequency change request. Indicates the number of the entry in the frequency table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bits [7:2]**

Reserved, RES0.

**HDBG, bit [1]**

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

`0` System counter ignores Halt-on-debug.

`1` Asserted Halt-on-debug signal halts system counter update.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EN, bit [0]**

Enables the counter:

`0` System counter disabled.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 System counter enabled.

When this register has an architecturally-defined reset value, this field resets to `0`.

### Accessing the CNTCR:

CNTCR can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | `0x000` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

**Purpose**

Indicates the current count value.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTControlBase | RW |
| CNTReadBase | RO |

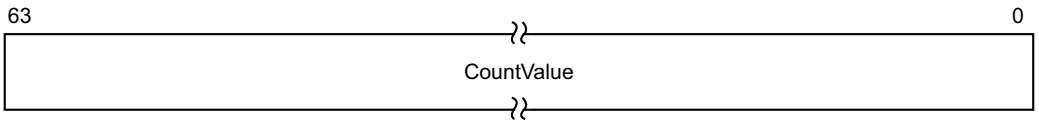
A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the writable copy of the register:

- If the counter is enabled, the effect if writing the register is UNPREDICTABLE.
- If the system implements both Secure and Non-secure states, the register is writable only by Secure writes.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

**Configurations**



There are no configuration notes.

**Attributes**

CNTCV is a 64-bit register.

#### Field descriptions

The CNTCV bit assignments are:

**CountValue, bits [63:0]**

Indicates the counter value.

#### Accessing the CNTCV:

CNTCV[31:0] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | 0x008 |
| Timer | CNTReadBase | 0x000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

CNTCV[63:32] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | 0x00C |
| Timer | CNTReadBase | 0x004 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

**Purpose**

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

**Usage constraints**

This register is accessible as follows:

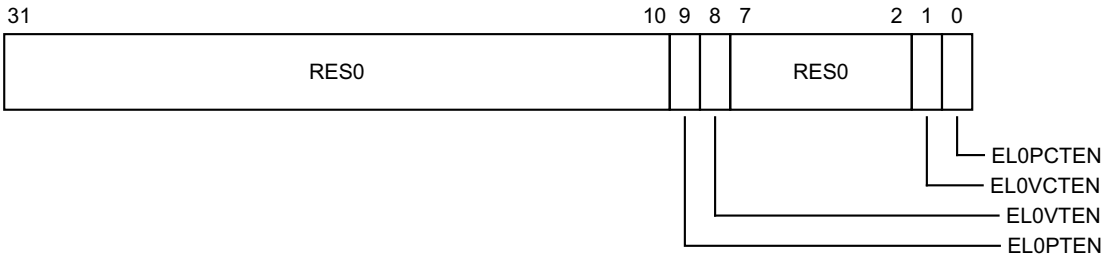
| Default |
|---|
| RW |

If CNTEL0ACR is implemented, it is implemented as a RW register in the CNTBaseN frame when the value of bit[0] of CNTTIDR.Frame<n> is 1, otherwise the encoding is RES0.

If CNTEL0ACR is not implemented:

- The register location is RAZ/WI.
- The registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible in the corresponding CNTEL0BaseN frame.

**Configurations**



In each implemented CNTBaseN frame, CNTEL0ACR is optional.

**Attributes**

CNTEL0ACR is a 32-bit register.

#### Field descriptions

The CNTEL0ACR bit assignments are:

**Bits [31:10]**

Reserved, RES0.

**EL0PTEN, bit [9]**

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

`0` No access. Registers are RES0 in the second view.

`1` Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EL0VTEN, bit [8]**

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

`0` No access. Registers are RES0 in the second view.

`1` Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

**Bits [7:2]**

Reserved, RES0.

**EL0VCTEN, bit [1]**

Second view read access control for CNTVCT and CNTFRQ. The possible values of this bit are:

`0` CNTVCT is not visible in the second view.
If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.

`1` Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.

**EL0PCTEN, bit [0]**

Second view read access control for CNTPCT and CNTFRQ. The possible values of this bit are:

`0` CNTPCT is not visible in the second view.
If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.

`1` Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.

## Accessing the CNTEL0ACR:

CNTEL0ACR can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | `0x014` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

**Purpose**

Indicates the base frequency of the system counter.

**Usage constraints**

This register is accessible as follows:

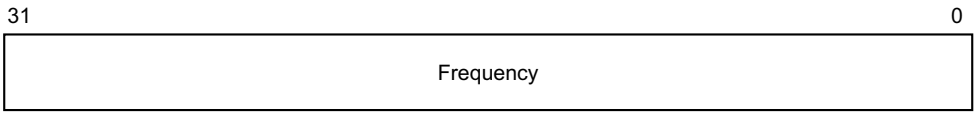
| Default |
|---|
| RO or RW |

**Configurations**

The possible frequencies for the system counter are stored as 32-bit words starting with the base frequency, CNTFID0.

A 32-bit word of zero value after the final frequency mode entry marks the end of the frequency modes table.

Typically, the frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.



If the frequency modes table is in read/write memory, ARM strongly recommends that the frequency modes table is not updated once the system is running.

**Attributes**

CNTFID0 is a 32-bit register.

#### Field descriptions

The CNTFID0 bit assignments are:

**Frequency, bits [31:0]**

The base frequency of the system counter, in Hz.

#### Accessing the CNTFID0:

CNTFID0 can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | 0x020 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.6 CNTFID<n>, Counter Frequency IDs, n = 1 - 23

The CNTFID<n> characteristics are:

**Purpose**

Indicates alternative system counter update frequencies.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO or RW |

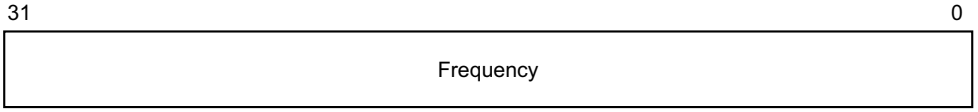
**Configurations**

CNTFID<n> is optional to implement in the external register interface.

The possible frequencies for the system counter are stored as 32-bit words starting with the base frequency, CNTFID0.

A 32-bit word of zero value after the final frequency mode entry marks the end of the frequency modes table. The only required entry in the table is the entry for CNTFID0.

Typically, the frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialise the table entries as part of its start-up sequence.



If the frequency modes table is in read/write memory, ARM strongly recommends that the frequency modes table is not updated once the system is running.

**Attributes**

CNTFID<n> is a 32-bit register.

#### Field descriptions

The CNTFID<n> bit assignments are:

**Frequency, bits [31:0]**

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. ARM strongly recommends that all frequency values in the table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / selected frequency)

#### Accessing the CNTFID<n>:

CNTFID<n> can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | `0x020` + 4n |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

**Purpose**

Holds the clock frequency of the system counter.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTCTLBase | RW |
| CNTBaseN | Config-RO |
| CNTEL0BaseN | Config-RO |

For the CNTBaseN and CNTEL0BaseN frames:

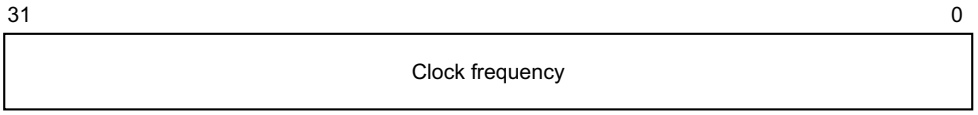
- A RO copy of CNTFRQ is implemented in the CNTBaseN frame when both:
  - CNTACR<n>.RFRQ is 1.
  - Bit[0] of CNTTIDR.Frame<n> is 1.

  Otherwise the encoding in CNTBaseN is RES0.
- When CNTFRQ is RO in the CNTBaseN frame, it is also RO in the CNTEL0BaseN frame if bit[2] of CNTTIDR.Frame<n> is 1 and either:
  - The value of CNTEL0ACR.EL0VCTEN is 1.
  - The value of CNTEL0ACR.EL0PCTEN is 1.

  Otherwise the CNTFRQ encoding in CNTEL0BaseN frame is RES0.

In a system that implements both Secure and Non-secure states, this register is only accessible in Secure state.

**Configurations**



There are no configuration notes.

**Attributes**

CNTFRQ is a 32-bit register.

#### Field descriptions

The CNTFRQ bit assignments are:

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTFRQ:

CNTFRQ can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x010 |
| Timer | CNTEL0BaseN | 0x010 |
| Timer | CNTCTLBase | 0x000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.8 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

**Purpose**

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

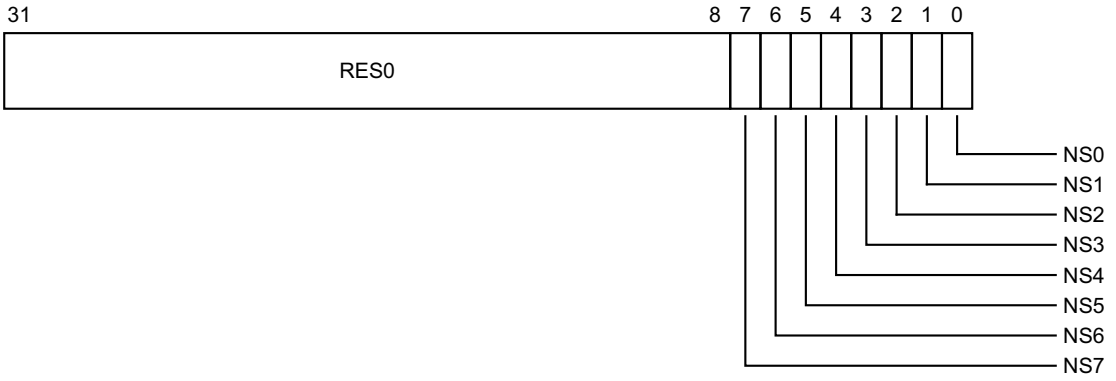
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RW |

In a system that implements both Secure and Non-secure states, this register is only accessible in Secure state.

**Configurations**



There are no configuration notes.

**Attributes**

CNTNSAR is a 32-bit register.

#### Field descriptions

The CNTNSAR bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**NS<n>, bit [n], for n = 0 to 7**

Non-secure access to frame n. The possible values of this bit are:

`0` Secure access only. Behaves as RES0 to Non-secure accesses.

`1` Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

### Accessing the CNTNSAR:

CNTNSAR can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTCTLBase | 0x004 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.9 CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

**Purpose**

Control register for the physical timer.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RW |
| CNTEL0BaseN | Config-RW |

CNTP_CTL is implemented as a RW register in the CNTBaseN frame when both:

- CNTACR<n>.RWPT is 1.
- Bit[0] of CNTTIDR.Frame<n> is 1.

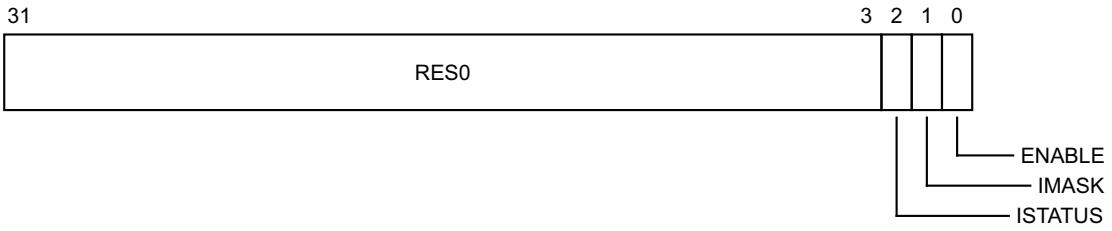
Otherwise the encoding in the CNTBaseN frame is RES0.

When CNTP_CTL is implemented as a RW register in the CNTBaseN frame, it is also implemented as a RW register in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0PTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTP_CTL register in the CNTEL0BaseN frame is RES0.

**Configurations**



There are no configuration notes.

**Attributes**

CNTP_CTL is a 32-bit register.

#### Field descriptions

The CNTP_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

0 Timer condition is not asserted.

1 Timer condition is asserted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

`0` Timer output signal is not masked.

`1` Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

`0` Timer disabled.

`1` Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTP_CTL:

CNTP_CTL can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | `0x02C` |
| Timer | CNTEL0BaseN | `0x02C` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.10 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the EL1 physical timer.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RW |
| CNTEL0BaseN | Config-RW |

CNTP_CVAL is implemented as a RW register in the CNTBaseN frame when both:

- CNTACR<n>.RWPT is 1.
- Bit[0] of CNTTIDR.Frame<n> is 1.

Otherwise the encoding in the CNTBaseN frame is RES0.

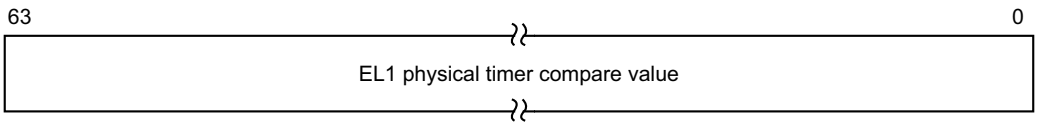
When CNTP_CVAL is implemented as a RW register in the CNTBaseN frame, it is also implemented as a RW register in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0PTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTP_CVAL register in the CNTEL0BaseN frame is RES0.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

**Configurations**



There are no configuration notes.

**Attributes**

CNTP_CVAL is a 64-bit register.

#### Field descriptions

The CNTP_CVAL bit assignments are:

**Bits [63:0]**

EL1 physical timer compare value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTP_CVAL:

CNTP_CVAL[31:0] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x020 |
| Timer | CNTEL0BaseN | 0x020 |

CNTP_CVAL[63:32] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x024 |
| Timer | CNTEL0BaseN | 0x024 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.11 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer. This provides a 32-bit downcounter.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RW |
| CNTEL0BaseN | Config-RW |

CNTP_TVAL is implemented as a RW register in the CNTBaseN frame when both:

- CNTACR<n>.RWPT is 1.
- Bit[0] of CNTTIDR.Frame<n> is 1.

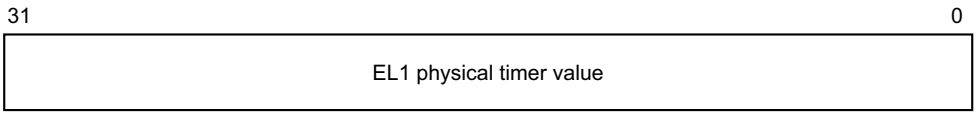
Otherwise the encoding in the CNTBaseN frame is RES0.

When CNTP_TVAL is implemented as a RW register in the CNTBaseN frame, it is also implemented as RW in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0PTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTP_TVAL register in the CNTEL0BaseN frame is RES0.

**Configurations**



There are no configuration notes.

**Attributes**

CNTP_TVAL is a 32-bit register.

#### Field descriptions

The CNTP_TVAL bit assignments are:

**Bits [31:0]**

EL1 physical timer value.

#### Accessing the CNTP_TVAL:

CNTP_TVAL can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x028 |
| Timer | CNTEL0BaseN | 0x028 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.12 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RO |
| CNTEL0BaseN | Config-RO |

CNTPCT is implemented as a RO register in the CNTBaseN frame when both:

- CNTACR<n>.RPCT is 1.
- Bit[0] of CNTTIDR.Frame<n> is 1.

Otherwise the encoding in the CNTBaseN frame is RES0.

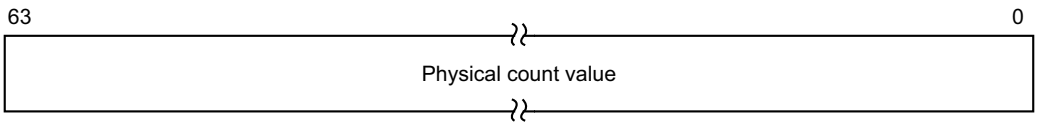
When CNTPCT is implemented as a RO register in the CNTBaseN frame, it is also implemented as a RO register in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0PCTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTPCT register in the CNTEL0BaseN frame is RES0.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

**Configurations**



There are no configuration notes.

**Attributes**

CNTPCT is a 64-bit register.

## Field descriptions

The CNTPCT bit assignments are:

**Bits [63:0]**

Physical count value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTPCT:

CNTPCT[31:0] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x000 |
| Timer | CNTEL0BaseN | 0x000 |

CNTPCT[63:32] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x004 |
| Timer | CNTEL0BaseN | 0x004 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.13 CNTSR, Counter Status Register

The CNTSR characteristics are:

**Purpose**

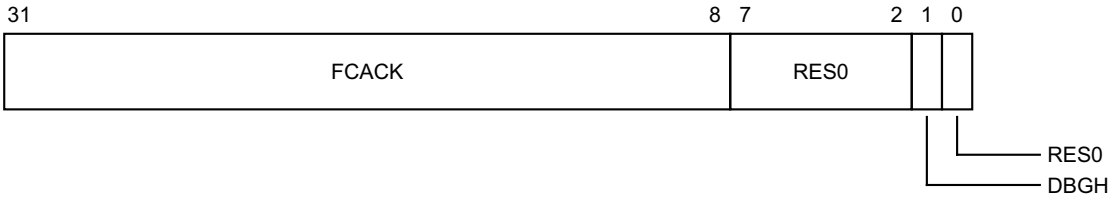
Provides counter frequency status information.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**



There are no configuration notes.

**Attributes**

CNTSR is a 32-bit register.

#### Field descriptions

The CNTSR bit assignments are:

**FCACK, bits [31:8]**

Frequency change acknowledge. Indicates the currently selected entry in the frequency table.

When this register has an architecturally-defined reset value, this field resets to `0`.

**Bits [7:2]**

Reserved, RES0.

**DBGH, bit [1]**

Indicates whether the counter is halted because the Halt-on-Debug signal is asserted:

`0` Counter is not halted.

`1` Counter is halted.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Bit [0]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTSR:

CNTSR can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | 0x004 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.14 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

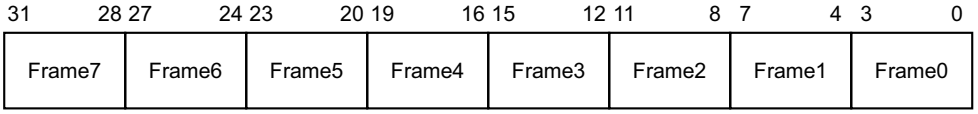
**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

This register is accessible in both Secure and Non-secure states.

**Configurations**



There are no configuration notes.

**Attributes**

CNTTIDR is a 32-bit register.

## Field descriptions

The CNTTIDR bit assignments are:

**Frame<n>, bits [4n+3:4n], for n = 0 to 7**

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2] indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

| Bit[2] | Meaning |
|---|---|
| 0 | Frame <n> does not have a second view. CNTEL0Base<n> is RES0. |
| 1 | Frame <n> has a second view, CNTEL0Base<n>. |

If bit[0] is 0, bit[2] is RES0.

Bit[1] indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The possible values of bit[1] are:

| Bit[1] | Meaning |
|---|---|
| 0 | Frame <n> does not have virtual capability. The virtual time and offset registers are RES0. |
| 1 | Frame <n> has virtual capability. The virtual time and offset registers are implemented. |

If bit[0] is 0, bit[1] is RES0.

Bit[0] indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

| Bit[0] | Meaning |
|---|---|
| 0 | Frame <n> not implemented. All registers associated with the frame are RES0. |
| 1 | Frame <n> is implemented. |

### Accessing the CNTTIDR:

CNTTIDR can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTCTLBase | 0x008 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.15 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RW |
| CNTEL0BaseN | Config-RW |

If CNTV_CTL is implemented, it is implemented as a RW register in the CNTBaseN frame when both:

- The value of CNTACR<n>.RWVT is 1.
- Bits[1:0] of CNTTIDR.Frame<n> are 1.

Otherwise the encoding in the CNTBaseN frame is RES0.

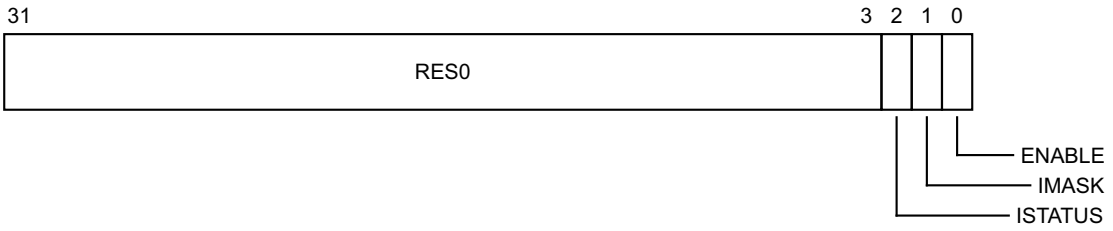
When CNTV_CTL is implemented as a RW register in the CNTBaseN frame, if the value of CNTEL0ACR.EL0VTEN is 1 it is also implemented as a RW register in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0VTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTV_CTL register in the CNTEL0BaseN frame is RES0.

If CNTV_CTL is not implemented, the register location is RAZ/WI.

**Configurations**



CNTV_CTL is optional to implement in the external register interface.

**Attributes**

CNTV_CTL is a 32-bit register.

#### Field descriptions

The CNTV_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

`0` Timer condition is not asserted.

`1` Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

`0` Timer output signal is not masked.

`1` Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

`0` Timer disabled.

`1` Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTV_CTL:

CNTV_CTL can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | `0x03C` |
| Timer | CNTEL0BaseN | `0x03C` |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.16 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RW |
| CNTEL0BaseN | Config-RW |

If CNTV_CVAL is implemented, it is implemented as a RW register in the CNTBaseN frame when both:

- The value of CNTACR<n>.RWVT is 1.
- Bits[1:0] of CNTTIDR.Frame<n> are 1.

Otherwise the encoding in the CNTBaseN frame is RES0.

When CNTV_CVAL is implemented as a RW register in the CNTBaseN frame, it is also implemented as a RW register in the CNTEL0BaseN frame if both:

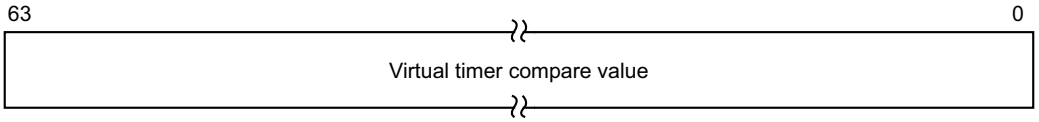
- CNTEL0ACR.EL0VTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTV_CVAL register in the CNTEL0BaseN frame is RES0.

If CNTV_CVAL is not implemented, the register location is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

**Configurations**



CNTV_CVAL is optional to implement in the external register interface.

**Attributes**

CNTV_CVAL is a 64-bit register.

#### Field descriptions

The CNTV_CVAL bit assignments are:

**Bits [63:0]**

Virtual timer compare value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTV_CVAL:

CNTV_CVAL[31:0] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x030 |
| Timer | CNTEL0BaseN | 0x030 |

CNTV_CVAL[63:32] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x034 |
| Timer | CNTEL0BaseN | 0x034 |

### I3.5.17 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RW |
| CNTEL0BaseN | Config-RW |

If CNTV_TVAL is implemented, it is implemented as a RW register in the CNTBaseN frame when both:

- The value of CNTACR<n>.RWVT is 1.
- Bits[1:0] of CNTTIDR.Frame<n> are 1.

Otherwise the encoding in the CNTBaseN frame is RES0.

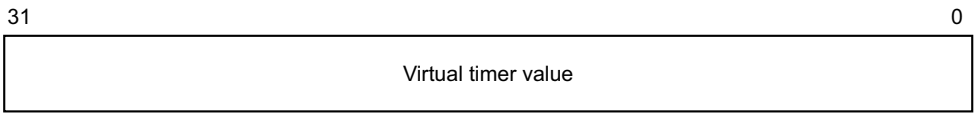
When CNTV_TVAL is implemented as a RW register in the CNTBaseN frame, it is also implemented as RW in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0VTEN is 1
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTV_TVAL register in the CNTEL0BaseN frame is RES0.

If CNTV_TVAL is not implemented, the register location is RAZ/WI.

**Configurations**



CNTV_TVAL is optional to implement in the external register interface.

**Attributes**

CNTV_TVAL is a 32-bit register.

## Field descriptions

The CNTV_TVAL bit assignments are:

**Bits [31:0]**

Virtual timer value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTV_TVAL:

CNTV_TVAL can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x038 |
| Timer | CNTEL0BaseN | 0x038 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.18 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value.

**Usage constraints**

This register is accessible as follows:

| Frame | Accessibility |
|---|---|
| CNTBaseN | Config-RO |
| CNTEL0BaseN | Config-RO |

CNTVCT is implemented as a RO register in the CNTBaseN frame when both:

- CNTACR<n>.RVCT is 1
- Bit[0] of CNTTIDR.Frame<n> is 1.

Otherwise the encoding in the CNTBaseN frame is RES0.

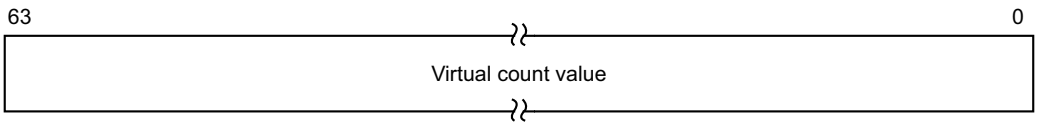
When CNTVCT is implemented as a RO register in the CNTBaseN frame, it is also implemented as a RO register in the CNTEL0BaseN frame if both:

- CNTEL0ACR.EL0VCTEN is 1.
- Bit[2] of CNTTIDR.Frame<n> is 1.

Otherwise the CNTVCT register in the CNTEL0BaseN frame is RES0.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

**Configurations**



There are no configuration notes.

**Attributes**

CNTVCT is a 64-bit register.

#### Field descriptions

The CNTVCT bit assignments are:

**Bits [63:0]**

Virtual count value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTVCT:

CNTVCT[31:0] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x008 |
| Timer | CNTEL0BaseN | 0x008 |

CNTVCT[63:32] can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTBaseN | 0x00C |
| Timer | CNTEL0BaseN | 0x00C |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.19 CNTVOFF{<n>}, Counter-timer Virtual Offset

The CNTVOFF{<n>} characteristics are:

**Purpose**

Holds the 64-bit virtual offset.

**Usage constraints**

This register is accessible as follows:

| Frame | Mnemonic | Accessibility |
|---|---|---|
| CNTCTLBase | CNTVOFF<n>, n = 1 to 7 | Config-RW |
| CNTBaseN | CNTVOFF | Config-RO |
| CNTEL0BaseN | CNTVOFF | Config-RO |

For each implemented CNTBaseN frame, it is IMPLEMENTATION DEFINED whether the timer distinguishes between real time and virtual time.

If the frame<n> timer supports this distinction and bits[1:0] of CNTTIDR.Frame<n> are 1, CNTVOFF<n> is implemented as a RW register in the CNTCTLBase frame. Otherwise the CNTVOFF<n> encoding in the CNTCTLBase frame is RES0.

In a system that implements both Secure and Non-secure states:

- CNTVOFF<n> is always accessible in Secure state.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible in Non-secure state.

If CNTVOFF<n> is not implemented, the register location is RAZ/WI.

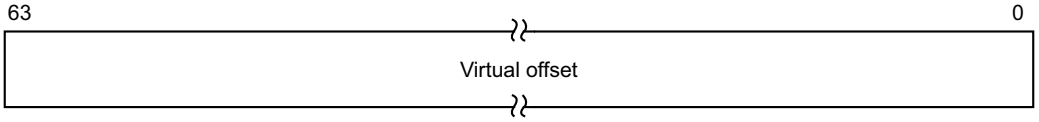
CNTVOFF is implemented as a RO register in the CNTBaseN frame when the value of CNTACR<n>.RVOFF is 1, otherwise the encoding in the CNTBaseN frame is RES0.

When CNTVOFF is implemented as a RO register in the CNTBaseN frame, and if bit[2] of CNTTIDR.Frame<n> is 1, CNTVOFF is also implemented as a RO register in the CNTEL0BaseN frame. When CNTVOFF is not implemented in the CNTBaseN frame, or when the value of bit[2] of CNTTIDR.Frame<n> is 0, the encoding in CNTEL0BaseN is RES0.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.

**Configurations**

CNTVOFF{<n>} is optional to implement in the external register interface.



CNTACR<n>.RVOFF enables access to this register for frame CNTBaseN.

**Attributes**

CNTVOFF{<n>} is a 64-bit register.

#### Field descriptions

The CNTVOFF{<n>} bit assignments are:

**Bits [63:0]**

Virtual offset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTVOFF:

CNTVOFF{<n>} can be accessed through the memory-mapped interface:

| Component | Mnemonic | Frame | Offset |
|---|---|---|---|
| Timer | CNTVOFF<n>[31:0] | CNTCTLBase | 0x080 + 8n |
| Timer | CNTVOFF<n>[63:32] | CNTCTLBase | 0x084 + 8n |
| Timer | CNTVOFF[31:0] | CNTBaseN | 0x018 |
| Timer | CNTVOFF[63:32] | CNTBaseN | 0x01C |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### I3.5.20 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

**Usage constraints**

This register is accessible as follows:

| Default |
|---|
| RO |

**Configurations**

These registers are implemented independently in each of the frames accessed through the different memory maps.

These registers are accessible in both Secure and Non-secure states.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the ARM Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of `0xF`.

**Attributes**

CounterID<n> is a 32-bit register.

#### Field descriptions

The CounterID<n> bit assignments are:

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

#### Accessing the CounterID<n>:

CounterID<n> can be accessed through the memory-mapped interface:

| Component | Frame | Offset |
|---|---|---|
| Timer | CNTControlBase | `0xFD0` + 4n |
| Timer | CNTReadBase | `0xFD0` + 4n |
| Timer | CNTBaseN | `0xFD0` + 4n |
| Timer | CNTEL0BaseN | `0xFD0` + 4n |
| Timer | CNTCTLBase | `0xFD0` + 4n |

# Part J

## Architectural Pseudocode

# Chapter J1
# ARMv8 Pseudocode

This chapter contains pseudocode that describes many features of the ARMv8 architecture. It contains the following sections:

- *Pseudocode for AArch64 operations* on page J1-5214.
- *Pseudocode for AArch32 operation* on page J1-5273.
- *Shared pseudocode* on page J1-5344.

**Note**

**Status of this appendix in the beta release document**

ARM is currently working to improve the organization and presentation of the pseudocode in this document, including providing improved linking within the pseudocode. Currently, this chapter contains the complete pseudocode library for ARMv8, split between:

- Functions, or versions of functions, that are specific to execution in AArch64 state.
- Functions, or versions of functions, that are specific to execution in AArch32state.
- Functions that apply to execution in either Execution state.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## J1.1 Pseudocode for AArch64 operations

This section holds the pseudocode for execution in AArch64 state. Functions listed in this section are identified as `AArch64.FunctionName`. Some of these functions have an equivalent AArch32 function, `AArch32.FunctionName`. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `aarch64/debug/breakpoint`.

The top-level sections of the AArch64 pseudocode hierarchy are:

- *aarch64/debug*.
- *aarch64/exceptions* on page J1-5220.
- *aarch64/functions* on page J1-5237.
- *aarch64/instrs* on page J1-5250.
- *aarch64/translation* on page J1-5257.

### J1.1.1 aarch64/debug

This section includes the following pseudocode functions:

- *aarch64/debug/breakpoint/AArch64.BreakpointMatch*.
- *aarch64/debug/breakpoint/AArch64.BreakpointValueMatch* on page J1-5215.
- *aarch64/debug/breakpoint/AArch64.StateMatch* on page J1-5216.
- *aarch64/debug/enables/AArch64.GenerateDebugExceptions* on page J1-5217.
- *aarch64/debug/enables/AArch64.GenerateDebugExceptionsFrom* on page J1-5217.
- *aarch64/debug/pmu/AArch64.CheckForPMUOverflow* on page J1-5217.
- *aarch64/debug/pmu/AArch64.CountEvents* on page J1-5217.
- *aarch64/debug/pmu/AArch64.ProfilingProhibited* on page J1-5218.
- *aarch64/debug/takeexceptiondbg/AArch64.TakeExceptionInDebugState* on page J1-5218.
- *aarch64/debug/watchpoint/AArch64.WatchpointByteMatch* on page J1-5219.
- *aarch64/debug/watchpoint/AArch64.WatchpointMatch* on page J1-5220.

#### aarch64/debug/breakpoint/AArch64.BreakpointMatch

```
// AArch64.BreakpointMatch()
// =========================
// Breakpoint matching in an AArch64 translation regime.

boolean AArch64.BreakpointMatch(integer n, bits(64) vaddress, integer size)
    assert !ELUsingAArch32(S1TranslationRegime());
    assert n <= UInt(ID_AA64DFR0_EL1.BRPs);

    enabled = DBGBCR_EL1[n].E == '1';

    state_match = AArch64.StateMatch(DBGBCR_EL1[n].SSC, DBGBCR_EL1[n].HMC, DBGBCR_EL1[n].PMC,
                                     linked, DBGBCR_EL1[n].LBN, ispriv);
    value_match = AArch64.BreakpointValueMatch(n, vaddress, linked_to);

    if HaveAnyAArch32() && size == 4 then                 // Check second halfword
        // If the breakpoint address and BAS of an Address breakpoint match the address of the
        // second halfword of an instruction, but not the address of the first halfword, it is
        // CONSTRAINED UNPREDICTABLE whether or not this breakpoint generates a Breakpoint debug
        // event.
        match_i = AArch64.BreakpointValueMatch(n, vaddress + 2, linked_to);
        if !value_match && match_i then
            value_match = ConstrainUnpredictableBool();

    if vaddress<1> == '1' && DBGBCR_EL1[n].BAS == '1111' then
        // The above notwithstanding, if DBGBCR_EL1[n].BAS == '1111', then it is CONSTRAINED
        // UNPREDICTABLE whether or not a Breakpoint debug event is generated for an instruction
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        // at the address DBGBVR_EL1[n]+2.
        if value_match then value_match = ConstrainUnpredictableBool();

    match = value_match && state_match && enabled;

    return match;
```

### aarch64/debug/breakpoint/AArch64.BreakpointValueMatch

```
// AArch64.BreakpointValueMatch()
// ==============================

boolean AArch64.BreakpointValueMatch(integer n, bits(64) vaddress, boolean linked_to)

    // "n" is the identity of the breakpoint unit to match against
    // "vaddress" is the current instruction address, ignored if linked_to is TRUE and for Context
    //    matching breakpoints.
    // "linked_to" is TRUE if this is a call from StateMatch for linking.

    // If a non-existant breakpoint then it is CONSTRAINED UNPREDICTABLE whether this gives
    // no match or the breakpoint is mapped to another UNKNOWN implemented breakpoint.
    if n > UInt(ID_AA64DFR0_EL1.BRPs) then
        (c, n) = ConstrainUnpredictableInteger(0, UInt(ID_AA64DFR0_EL1.BRPs));
        assert c IN {Constraint_DISABLED, Constraint_UNKNOWN};
        if c == Constraint_DISABLED then return FALSE;

    // If this breakpoint is not enabled, it cannot generate a match. (This could also happen on a
    // call from StateMatch for linking.)
    if DBGBCR_EL1[n].E == '0' then return FALSE;

    context_aware = (n >= UInt(ID_AA64DFR0_EL1.BRPs) - UInt(ID_AA64DFR0_EL1.CTX_CMPs));

    // If BT is set to a reserved type, behaves either as disabled or as a not-reserved type.
    type = DBGBCR_EL1[n].BT;
    if (type == 'x1xx' ||                                           // Reserved
          (type != '0x0x' && !context_aware) ||                     // Context matching
          (type == '1xxx' && !HaveEL(EL2))) then                    // VMID match

## J1.2 Pseudocode for AArch32 operation

This section holds the pseudocode for execution in AArch32 state. Functions listed in this section are identified as `AArch32.FunctionName`. Some of these functions have an equivalent AArch64 function, `AArch64.FunctionName`. This section is organised by functional groups, with the functional groups being indicated by hierarchical path names, for example `aarch32/debug/breakpoint`.

The top-level sections of the AArch32 pseudocode hierarchy are:

- *aarch32/debug*.
- *aarch32/exceptions* on page J1-5281.
- *aarch32/functions* on page J1-5299.
- *aarch32/translation* on page J1-5324.

### J1.2.1 aarch32/debug

This section includes the following pseudocode functions:

- *aarch32/debug/VCRMatch/AArch32.VCRMatch*.
- *aarch32/debug/authentication/AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled* on page J1-5274.
- *aarch32/debug/breakpoint/AArch32.BreakpointMatch* on page J1-5274.
- *aarch32/debug/breakpoint/AArch32.BreakpointValueMatch* on page J1-5275.
- *aarch32/debug/breakpoint/AArch32.StateMatch* on page J1-5276.
- *aarch32/debug/enables/AArch32.GenerateDebugExceptions* on page J1-5277.
- *aarch32/debug/enables/AArch32.GenerateDebugExceptionsFrom* on page J1-5277.
- *aarch32/debug/pmu/AArch32.CheckForPMUOverflow* on page J1-5277.
- *aarch32/debug/pmu/AArch32.CountEvents* on page J1-5278.
- *aarch32/debug/pmu/AArch32.ProfilingProhibited* on page J1-5278.
- *aarch32/debug/takeexceptiondbg/AArch32.EnterHypModeInDebugState* on page J1-5279.
- *aarch32/debug/takeexceptiondbg/AArch32.EnterModeInDebugState* on page J1-5279.
- *aarch32/debug/takeexceptiondbg/AArch32.EnterMonitorModeInDebugState* on page J1-5280.
- *aarch32/debug/watchpoint/AArch32.WatchpointByteMatch* on page J1-5280.
- *aarch32/debug/watchpoint/AArch32.WatchpointMatch* on page J1-5281.
